摘要: 提高籽粒品质和产量是当前国内小麦生产的核心。小麦品质和产量取决于基因型、生态环境(如土壤肥力等)和栽培技术(尤其是养分管理技术)。长期肥料试验是研究养分管理对小麦产量和品质影响的有效手段, 迄今, 长期施肥对小麦产量的影响报道很多, 但对籽粒品质的影响报道很少。在 20a 长期定位肥料试验的基础上, 研究了有机无机肥长期配合施用对不同类型小麦籽粒品质性状的影响。结果表明, 有机肥主效应对小麦籽粒产量有显著作用, 而对大部分品质指标无影响; 无机肥处理主效应及有机无机肥交互效应对籽粒产量和大部分品质性状均有显著影响。有机无机肥料配合施用与单施无机肥处理相比提高了小麦大部分品质性状, 有利于强筋小麦籽粒产量和品质的同步提高, 但不利于弱筋小麦品质的改善。进一步分析了土壤肥力及磷钾肥对小麦籽粒品质的影响。

Abstract: The improvement of grain quality and yield is key in China's wheat production. Both grain quality and yield depend on used genotype, growth conditions including soil fertility, as well as crop management, especially nutrient management. Long-term fertility experiments facilitate research on the effects of nutrient management on wheat yield and quality. The long-term effects of nutrient management on wheat yield have been reported in literatures, but effects on grain quality are less known. In the present paper, a 20-year nutrient management experiment with wheat-maize double cropping system was used to investigate the effects of manure and fertilizers on grain yield and quality in different winter wheat (*Triticum aestivum* L.) cultivars, during three growing seasons from 2000 to 2003. The eight nutrient management treatments included: a control without supply of external nutrients (CK), only N fertilizer (N), N and P fertilizer (NP), N, P and K fertilizer (NPK), only manure (M), manure and N fertilizer (MN), manure and N and P fertilizer (MNP), manure and N, P and K fertilizer (MNPK). In the 2000~2001 season, the gluten rich cultivars Wanmai 38 and Yan 2801 were used, while in 2001~2002 and 2003~2003, the gluten rich cultivars Yan 2801, Xuzhou 26 and the gluten poor cultivar Xuzhou 25 were used. The main effect of manure was significant for grain yield, while it was insignificant for most quality traits. The main effects of fertilizer and the interaction between manure and fertilizer were significant on both grain yield and major grain quality traits. The long-term application of

manure in combination with fertilizers had more effect on most of the quality traits compared to the fertilizer treatments only. The results indicate that the combined use of organic and inorganic nutrient sources favors the quality of gluten rich wheat varieties, but reduces the quality of gluten poor wheat varieties. Soil organic matter, total N, available P and available K in the soil were not correlated with the major grain quality traits, but were significantly correlated with the grain yield of all varieties. This suggests that mainly nutrient management and not soil fertility determined wheat grain quality in the present study.

Key words: winter wheat (*Triticum aestivum L.*); grain quality; manure; fertilizer; long-term experiment

小麦籽粒品质形成不仅与基因型密切相关^[1,2],更受生态条件的影响^[3~5],其中地力条件与肥料运筹对品质的影响极为显著^[6~10]。长期定位肥料试验后,同种类型土壤形成了不同的土壤肥力,为研究土壤肥力与肥料运筹对小麦籽粒品质的影响提供了极为有利的基础条件。已有报道表明,长期定位施肥后,小麦籽粒品质性状产生显著变化^[11,12]。但上述研究多以普通小麦品种为材料,未涉及专用小麦品种,且品质性状多限于籽粒营养品质,对小麦加工品质性状的影响鲜有报道^[13],而长期定位施肥对专用小麦面团流变学特性的影响尚未见报道。本研究在已有20a长期定位肥料试验的基础上,选用优质强筋和弱筋专用小麦品种,研究了长期有机、无机肥料及其配合施用对小麦籽粒品质的影响,以期为专用小麦品质调优栽培技术的制订提供理论依据。

1 材料与方法

1.1 试验设计

试验在江苏省徐州农科所长期定位肥料试验地中进行。原试验从1980年秋播开始,土壤为黄泛冲积母质发育的黄潮土,质地为砂壤。土壤基础肥力为有机质10.8 g/kg、全氮0.66 g/kg、速效磷12 mg/kg、速效钾63 mg/kg、缓效钾738.5 mg/kg。

原试验为裂区设计:主区因子为有机肥处理,设施(M)与不施两个水平;裂区因子为无机肥处理,设4个水平,即空白(CK)、氮肥(N)、氮磷肥(NP)和氮磷钾肥(NPK),小区面积33.3 m²,重复4次。试验为小麦-玉米一年两熟制,氮、磷、钾化肥每季施用量均为:纯N 150 kg/hm²,其中50%做基肥在播种前施入,50%做追肥于拔节期施入;P₂O₅为75 kg/hm²;K₂O为112.5 kg/hm²。有机肥为厩肥,每季施用量为:1981~1984年施马粪37500 kg/hm²;1985~2001年施牛粪18750 kg/hm²。磷钾肥和有机肥均做为基肥一次性施入。

2000年选用强筋小麦品种皖麦38和烟2801,2001和2002年均选用强筋小麦品种烟2801和徐州26及弱筋小麦品种徐州25。品种因子为再裂区。各年度播前土壤养分含量见表1。除肥料因素外,其余田间管理措施基本同当地大田生产。

表1 不同施肥处理播种前土壤肥力状况

Table 1 Soil fertility status before sowing for different fertilization treatments in 2000 and 2001

NPK	12.5	0.91	13.1	65.1	12.1	1.10	13.5	66.4	

成熟后收获籽粒,经1个月生理成熟后测定各品质指标。因CK和N处理的单个重复样品量不足以满足面团流变学特性分析要求,面团流变学特性指标测定用4个重复的混合样品,而其余指标则均测定了4个重复。

1.2 测定项目与方法

湿面筋和干面筋含量测定用JJJM-54-115II型面筋测定时仪,按GB/T14608-93的方法测定,面筋指数用JZSM面筋指数测定时仪,降落值测定仪-II型降落值仪测定,沉降值按GB/T14607-1995的方法测定。淀粉含量按GB5006-85谷物籽粒粗淀粉测定法,蛋白质含量用凯氏定氮法测定^[14],蛋白质组分含量测定按连续震荡提取法^[15],用凯氏定氮法测定,全氮含量乘以系数

5.7 得蛋白质含量。

1.3 方差分析

因 2001~2002 和 2002~2003 年度试验结果趋势基本一致,因此仅列出产量、蛋白质和淀粉含量指标进行分析(表 2),其余指标均使用 2001~2002 年度试验数据。

方差分析用再裂区试验设计分析方法,用 Duncan 新复极差(SSR)法进行多重比较。

表 2 2001~2002 和 2002~2003 季节不同施肥处理对小麦品种籽粒粗蛋白和淀粉含量及产量的影响

2 结果与分析

2.1 对小麦产量数据影响

两年度试验结果均显示有机肥和无机肥主效应、有机肥与无机肥互作效应、无机肥与品种互作效应对产量的作用达到极显

著水平(表2、表3),而2001~2002和2002~2003年度试验中,品种主效应、有机肥与品种互作效应对产量的作用也达到显著至极显著水平(表2)。表明有机肥和无机肥主效应及有机无机肥交互效应对小麦产量的显著影响不受年际间差异的影响。两年产量结果中,各品种产量均以全量施肥处理最高,以不施肥处理(CK)产量最低,仅为最高产量的1/6~1/7。氮磷钾全施处理产量显著高于部分施肥处理。此外,有机无机肥配合施用后产量显著高于仅施无机肥的各处理,而且施用有机肥后,即使不施用钾肥(MNP)处理,产量也显著高于不施有机肥的氮磷钾肥全施的处理(NPK)。

有机肥和无机肥主效应、有机肥与无机肥的互作效应对籽粒淀粉含量无显著影响,而品种主效应和有机肥与品种的互作效应对籽粒淀粉含量产生显著影响。

两年度的试验结果(表2、表3)均表明,有机肥主效应对籽粒蛋白质含量无显著影响,无机肥和品种主效应、有机肥与无机肥互作效应、无机肥与品种的互作效应对小麦籽粒蛋白质含量具显著作用。2001~2002和2002~2003年度的试验结果还显示有机肥与品种的互作效应、有机肥和无机肥及品种的互作效应均显著影响籽粒蛋白质含量。2000~2001年度的试验中,M与CK处理间籽粒蛋白质含量则差异不大。2001~2002和2002~2003年度试验中,而M处理与CK处理相比,籽粒蛋白质含量却明显降低(2002~2003年度的烟2801除外)。这种年度间试验结果的差异,可能与不同年度有机无机肥配合施用对籽粒产量和蛋白质含量影响的幅度不同有关。如2000~2001和2002~2003年度试验中,M处理的产量仅为CK的2.1~2.7倍,而2001~2002年度为3.6~4.0倍。究其原因,2001~2002与2002~2003年度麦季较为干旱,各处理小麦产量均明显降低,而不施肥处理在这种逆境下的产量所受影响显著大于施肥处理,单施无机肥处理大于有机与无机肥配合施用处理。不同年度间各施肥处理对产量的不同影响,导致对籽粒蛋白质的稀释作用不同,最终影响到蛋白质含量的差异。

2.2 对小麦籽粒蛋白质各组分含量的影响

表3结果表明,有机肥主效应对籽粒清蛋白、球蛋白以及醇溶蛋白/麦谷蛋白比无显著影响,而对醇溶蛋白和麦谷蛋白含量具极显著的影响。无机肥处理主效应及有机无机肥的互作效应对籽粒蛋白质的各组分含量及醇溶蛋白/谷蛋白比具极显著的作用。除球蛋白含量外,蛋白质各组分含量及醇溶蛋白/谷蛋白比在品种间的差异达显著至极显著水平。

除烟2801的MNP处理籽粒麦谷蛋白含量略低于NP处理外,有机无机肥配合施用处理的籽粒醇溶蛋白和谷蛋白含量均高于单施无机肥处理,而随着无机养分种类的增多,有机无机肥配合施用处理与单施无机肥处理间籽粒中醇溶蛋白和谷蛋白含量差距呈缩小的趋势。

2.3 对面粉主要加工品质性状的影响

有机肥主效应仅对降落值具极显著的作用,无机肥处理及品种主效应对降落值、沉降值、干/湿面筋含量及面筋指数具显著的影响(表5、表6)。有机无机肥的互作效应对干/湿面筋含量及面筋指数在两年度试验中均表现出显著的影响,而对降落值和沉降值的影响因试验年份而异。

随着无机肥施用种类增多,有机无机肥配合处理及单施无机肥处理的干/湿面筋含量均呈上升趋势。M和MN处理的干/湿面筋含量相对应的单施无机肥处理,这可能与M和MN处理产量明显高于CK和单施N肥处理,导致CK和N处理干/湿面筋含量相对较高有关。MNP和MNPK处理的干/湿面筋含量则高于对应的单施无机肥处理,表明在较高的产量条件

2.4 对面团流变学特性的影响

表7示出,不同施肥处理对小麦面粉吸水率无显著影响。除烟2801的MNPK处理外,有机无机肥配合施用处理的面团形成时间均高于对应的单施无机肥处理。而除徐州25的MNPK处理外,有机无机肥配合施用处理的面团稳定时间和断裂时间均高于对应的单施无机肥处理。有机无机肥配合施用处理的评价值均高于对应的单施无机肥处理(徐州25的M和MNPK处理除外)。此外,各施肥处理面团形成时间、稳定时间、断裂时间和评价值均以烟2801最高,徐州25最低。

3 讨论

一般认为,土壤肥力对小麦籽粒品质的形成具显著的影响^[6],如较高肥力对强筋小麦籽粒品质的形成较为有利,而肥力较低或保肥水能力较差的土壤条件下更有利于弱筋小麦籽粒品质的形成^[11]。而本试验相关分析结果表明,各处理中土壤不同养

分含量与小麦品种不同品质性状相关性均不显著,仅籽粒产量与土壤有机质、全氮、速效磷和速效钾含量呈显著至极显著正相关(图1)。这可能因为本试验中不仅有地力水平,也有不同施肥处理因素的影响,而施肥的效应大于地力因素的影响,导致本试验中土壤肥力水平与籽粒品质无相关;还可能与不同处理下籽粒产量不同,导致对籽粒品质的部分“稀释”效应有关。

以往研究结果表明,有机无机肥料配合施用可提高小麦籽粒品质,但上述研究仅以籽粒蛋白质含量和氨基酸含量及组成为主要指标^[11,12]。而不同专用类型小麦对籽粒品质各指标的要求不同,而且有时可能是相反的。如,弱筋专用小麦要求较低含量的蛋白质、干/湿面筋,较短的面团稳定时间和形成时间,而强筋专用小麦则相反。本试验结果发现,有机肥主效应主要提高了小麦籽粒产量,对干/湿面筋含量和降落值也有一定提高,而对其他品质性状无显著影响。但有机肥与无机肥互作效应不仅对籽粒产量有显著影响,对大部分品质指标也有显著的作用。从总体上看,有机无机配合处理提高了小麦籽粒或面粉的主要品质性状,包括蛋白质、干/湿面筋含量、面团形成时间和稳定时间等。显然,这有利于强筋小麦籽粒品质的形成,但对弱筋小麦籽粒品质产生不利影响。换言之,有机无机肥配合施用对强筋小麦籽粒品质和产量具同步提高的作用,而在提高弱筋小麦产量的同时,却有可能降低其品质特性。如何通过有机肥和无机肥的合理施用,促进弱筋小麦籽粒品质和产量的同步提高,尚需进一步研究。
