摘要:采用实验生态学方法室内模拟研究了不同浓度沉积再悬浮颗粒物对马氏珠母贝清滤率、摄食率、吸收率的影响。结果表明:(1)水体中总悬浮颗粒物对马氏珠母贝清滤率的影响极显著($P<0.01$)。总悬浮颗粒物由低浓度(12.6 mg/L)趋高浓度(500 mg/L)时,马氏珠母贝的清滤率呈现峰值变化规律。与总悬浮颗粒物浓度50 mg/L时的最大清滤率(1.12 L·个体⁻¹·h⁻¹)比较,悬浮颗粒物浓度为500 mg/L时,清滤率达最小值(0.17 L·个体⁻¹·h⁻¹),其清滤率降幅达85%。这表明在高浓度悬浮颗粒物的水环境下,贝类受到环境胁迫,其生理和自身摄食机制受到限制,引起摄食减少和机体损伤。马氏珠母贝类的清滤率(CR)与总悬浮颗粒物浓度(TPM)之间的关系可表达为: $CR = -0.701 + 1.627 \times TPM - 0.463 \times TPM^2 + 0.036 \times TPM^3$ ($R^2 = 0.928$)。(2)水体中总悬浮颗粒物对马氏珠母贝摄食率的影响极显著($P<0.01$)。马氏珠母贝的摄食率随着总悬浮颗粒物浓度的升高而增加,在50 mg/L时达最大值(38.28 mg/h),当总悬浮颗粒物浓度超过50 mg/L时,摄食率反而下降,在总悬浮颗粒物浓度为500 mg/L时,降为最小值(16.22 mg/h),摄食率降幅为58%。随着悬浮颗粒物浓度的增加,马氏珠母贝摄食率受到的影响小于清滤率受到的影响。马氏珠母贝类的摄食率(IR)与总悬浮颗粒物浓度(TPM)之间的关系可表达为: $IR = -46.631 + 70.957 \times TPM - 18.385 \times TPM^2 + 1.367 \times TPM^3$ ($R^2 = 0.907$)。(3)水体中总悬浮颗粒物对马氏珠母贝吸收率影响极显著($P<0.01$)。总悬浮颗粒物由低浓度(12.6 mg/L)趋高浓度(500 mg/L)时,马氏珠母贝的吸收率呈逐渐下降趋势,在总悬浮颗粒物12.6 mg/L时,马氏珠母贝的吸收率最大(48.57%),而总悬浮颗粒物500 mg/L时,马氏珠母贝的吸收率最小(8.56%)。马氏珠母贝的吸收率(AE)与总悬浮颗粒物浓度(TPM)之间的关系可表达为: $AE = 52.189 + 0.132 \times TPM - 3.111 \times TPM^2 + 0.316 \times TPM^3$ ($R^2 = 0.976$)。

Abstract: *Pinctada martensii*, one of the important species for marine pearl culture, has brought about high economic and social benefits for the coastal communities. In this study, the effect of suspended sediment particles on the feeding physiology (clearance rate CR, ingestion rate IR and absorption efficiency AE) was investigated by adopting the measures of experimental ecology in laboratory to provide both insight into tolerance of *P. martensii* to environmental changes and guidelines for healthy culturing of *P. martensii*. The results were as followed: (1) The total suspended particle had significant effect on clearance rate of *P. martensii* ($P<0.01$), with peak value of clearance rate of *P. martensii* occurred as

the total suspended particle varying from 12.6 to 500 mg/L. Compared with the maximum value of 1.12 L·ind⁻¹·h⁻¹ at a concentration of 50 mg/L, the clearance rate of *P. martensii* reached the minimum value of 0.17 L·ind⁻¹·h⁻¹ at a concentration of 500 mg/L, decreased by 85%. The relationship of the clearance rate and the total suspended particle could be expressed by a function as: $CR = -0.701 + 1.627 \times TPM - 0.463 \times TPM^2 + 0.036 \times TPM^3$ ($R^2 = 0.928$). (2) The total suspended particle had significant effect on ingestion rate of *P. martensii* ($P < 0.01$), the ingestion rate of *P. martensii* increased with increasing suspended particle concentration from 12.6 to 50 mg/L and decreased with suspended particle concentration above 50 mg/L, with the maximum value of 38.28 mg/h at a concentration of 50 mg/L. However, the ingestion rate of *P. martensii* reached the minimum value of 16.22 mg/h at a concentration of 500 mg/L, which reduced to 58% compared with a concentration of 50 mg/L. This showed that the ingestion rate of *P. martensii* was less affected in contrast to the clearance rate, implying *P. martensii* was able to reduce clearance rate for maintaining relatively stable ingestion rate with increasing suspended particle concentration to maintain normal energy balance and to adapt to change of environment. The relationship between the ingestion rate and the total suspended particle could be described by a function as: $IR = -46.631 + 70.957 \times TPM - 18.385 \times TPM^2 + 1.367 \times TPM^3$ ($R^2 = 0.907$). (3) The absorption efficiency of *P. martensii* decreased from 48.57% to 8.56% with increasing suspended particle concentration from 12.6 to 50 mg/L. This suggested that the organic content decrease with increasing suspended particle concentration, causing reduction of the absorption efficiency of *P. martensii*. The relationship of the absorption efficiency and the total suspended particle could be described by a function as: $AE = 52.189 + 0.132 \times TPM - 3.111 \times TPM^2 + 0.316 \times TPM^3$ ($R^2 = 0.976$).

Key Words: *Pinctada martensii*, suspended sediment particle, clearance rate, ingestion rate, absorption efficiency

在浅海养殖水域,由于高流速的洪水、低潮潮汐、风浪活动和间歇性暴雨事件,极易引起沉积颗粒物再悬浮^[1]。沉积颗粒物的再悬浮过程引起了总悬浮颗粒物和颗粒有机物的增加,然而,由于悬浮颗粒物中较高比例的无机物的稀释效应导致悬浮颗粒物中颗粒有机物相对含量显著减少^[1-2],因此,沉积颗粒物再悬浮过程对海洋滤食性贝类可供摄食的食物颗粒物的数量和质量产生显著的影响^[3-5]。尽管悬浮颗粒物中包含滤食性贝类重要食物来源的颗粒有机物^[6],但是,沉积再悬浮颗粒物的浓度的日益增加已经对滤食性贝类产生负面影响^[7]。研究表明,悬浮颗粒物中的粉沙和粘土浓度的增加显著增加贝类假粪的产生,极大减少了可供摄食藻类的数量,同时对贝类的鳃造成损伤^[8-10]。双壳贝类长期暴露在较高浓度悬浮颗粒物的海水中,将导致供贝类生长和繁殖的能量的减少,进而对贝类种群产生有害影响^[11]。因此,沉积颗粒物的再悬浮过程不仅对水域的理化性质产生影响,而且直接影响滤食性贝类摄食生理生态和行为反应^[12]。

马氏珠母贝(*Pinctada martensii* (Dunker))是我国进行海水珍珠养殖的重要种类,隶属于瓣鳃纲(Lamellibranchia),翼形亚纲(Pteriomorpha),珍珠贝目(Pterioida),珍珠贝科(Pteriidae),主要分布于我国两广、海南、台湾等热带、亚热带海域。近几年,由于种质退化、环境恶化、人为因素等原因,珍珠质量及产量出现滑坡,已引起政府及各研究机构高度的重视,对此开展研究包括马氏珠母贝的选育^[13]、群体内遗传多样性^[14-15]、种群内自繁及种群杂交^[16-17]等侧重于种质退化方面;此外,随着养殖海区自身污染和陆源污染导致浅海养殖海区环境恶化或老化,使海水中沉积再悬浮颗粒物的浓度呈逐渐升高趋势,因养殖环境悬浮颗粒物中的浮泥在贝体表面的沉积极易引起多毛类寄生虫病(俗称黑心肝病或黑壳病)的暴发,已造成该贝出现了不同程度的死亡现象^[18]。多年来,沉积再悬浮颗粒物对贝类摄食生理的影响一直为研究的热点问题,国外学者研究了不同浓度悬浮颗粒物对欧洲鸟尾蛤(*Cerastoderma edulis*)^[19]、贻贝(*Mulinia edulis*)^[20]、海螂(*Mya arenaria*)^[21]、长牡蛎(*Crassostrea gigas*)^[12]、江珧(*Atrina zelandica*)^[11]的摄食行为和摄食生理的影响,国内学者探讨了沉积再悬浮颗粒物对栉孔扇贝(*Chlamys ferrerri*)、紫贻贝(*Mytilus edulis*)和菲律宾蛤仔(*Ruditapes philippinarum*)摄食生理的影响^[22]。马氏珠母贝作为我国湛江流沙湾珍珠养殖的重要贝类,随着养殖历史的长久和规模的日益增大,因海水中沉积再悬浮颗粒物浓度增大给该贝带来的负面影响受到广泛关注。因此,研究沉积再悬浮

颗粒物对马氏珠母贝摄食生理的影响,对于深层次理解该贝抵抗不良环境的能力显得十分必要。本研究通过模拟浅海沉积颗粒物再悬浮事件,以马氏珠母贝为材料,探讨沉积再悬浮颗粒物对该贝清滤率、摄食率和吸收率的影响,期望揭示该贝对环境变化的耐受力,为浅海贝类健康养殖提供理论依据。

1 材料和方法

1.1 沉积再悬浮颗粒物

采集湛江流沙湾马氏珠母贝筏式养殖区的表层底泥(<2 cm),按照宋强等^[22]方法,将底泥在60 °C下烘干至恒重,冷却干燥后,研磨,用200目筛绢过筛,保留的颗粒物粒径小于76 μm。

1.2 实验用贝

实验所用马氏珠母贝于2010年3—4月采自湛江流沙湾近海珍珠贝养殖区,挑选无损伤个体,洗刷去除表面的附着物,在广东海洋大学海水经济无脊椎动物实验室暂养7d,实验贝类的生物学数据见表1。暂养期间自然海水盐度为28.6—29.1,水温25.4—26.6 °C,pH值8.12—8.35,DO>5 mg/L,NH₄⁺-N<0.05 mg/L,24 h充气,每天投喂小球藻(*Chlorella* sp.)和亚心形扁藻(*Platymonas subcordiformis* (Wille) Hazen),日换水2次,每次换水1/2。实验前24 h停止投喂饵料,挑选健康的个体进行实验。实验前将贝类放入实验水体适应1 h。

表1 马氏珠母贝的生物学测定

Table 1 Biological measurement of *Pinctada martensii*

种类 Species	壳长/mm Shell length	壳高/mm Shell height	干组织重/g Dry tissue weight	干壳重/g Dry shell weight	肥满度/% Rich fitting
马氏珠母贝 <i>Pinctada martensii</i>	57.13±3.368	62.24±4.251	1.57±0.027	11.62±0.648	13.51

1.3 方法

1.3.1 实验设计

实验装置采用宋强等^[22]方法,实验期间,调节充气量使悬浮颗粒物悬浮均匀。海水体积100 L,海水理化因子同暂养条件。实验设置的悬浮颗粒物浓度分别为50、100、200、300、400、500 mg/L 6个实验组和1个低浓度海水组(12.6 mg/L,砂滤海水),每组设置3个重复组。每个水槽放置马氏珠母贝10个。实验各浓度组设置对照组,对照组水槽中不放置贝类,以消除沉降的影响。为消除昼夜摄食节律对实验结果的影响,实验在9:00和21:00各进行1次,取两个时间点的平均值。实验持续6 h后,从各个实验组和对照组分别取水样500 mL,用于分析实验水槽中悬浮颗粒物的变化情况,同时从各个实验组收集贝类排泄的粪便和假粪,用GF/C玻璃纤维滤纸抽滤,滤干后-20 °C下储备以备分析。用游标卡尺测量马氏珠母贝的壳长、壳高和壳宽,用解剖刀将软体部与壳分开,在80 °C烘干至恒重,称干壳质量和干组织质量。

1.3.2 悬浮颗粒物浓度的计算

悬浮颗粒物浓度的计算采用海水中总悬浮颗粒物和颗粒有机物来作为测定指标^[23]。TPM和POM测定的方法如下:用经过蒸馏水清洗并在马福炉中灼烧(450 °C)6 h后称重(W_0)并标记好的玻璃纤维滤纸(GF/C Whatman,孔径1.2 μm)抽滤500 mL的水样,所滤物用0.5 mol/L的甲酸铵(约10 mL)漂洗掉盐分后在110 °C下烘干至恒重,称重(W_{110});再在450 °C马福炉中灼烧6 h后称重(W_{450})。称量用SARTORIUS-BS110S电子天平(精确到0.1 mg)。按以下公式计算POM和TPM的值:

$$\text{POM} = W_{110} - W_{450}; \text{TPM} = W_{110} - W_0$$

粪便和假粪中的TPM和POM测定方法同上。

1.3.3 清滤率、滤食率和吸收效率的计算公式

(1)清滤率(Clearance rate CR),按Coughlan^[24]的公式:

$$CR = V \times (\ln C_0 - \ln C_t) / (N \times T)$$

式中, C_0 、 C_t 分别为实验开始和T时间时水体颗粒物浓度(mg/L);V为实验海水体积(L);T为实验持续时间(h);N为实验贝个体数。

(2) 摄食率(Ingestion Rate ,*IR*) ,按 MacDonald^[25] 的公式:

$$IR = CR \times C_0 - PPF$$

式中,*PPF* 为单位时间内排出的假粪量。

(3) 吸收效率(Absorption Efficiency ,*AE*) ,一般按 Conover^[26] 的公式 :

$$AE = (F - E) / [(1 - E) \times F] \times 100\%$$

式中,*F* 为水体中颗粒有机物的含量(POM/TPM) ,*E* 为粪便中有机物的含量(POM/TPM)。考虑到贝类在滤食过程中产生相当数量的假粪,本文采用宋强等^[22] 的计算公式:

$$AE = (OIR - OER) / OIR$$

式中,*OIR* 为贝类在单位时间内摄食的有机物量,*OER* 为贝类在单位时间内排出粪便的有机物量。

1.4 数据处理

为了消除实验中个体差异对马氏珠母贝生理指标的影响,将实验数据转换为 1 g 标准下的数据进行比较。转换用以下公式:

$$S_s = (1/W_e)^b \times S_e$$

式中,*S_s* 为标准动物(1 g)的生理指标;*S_e* 为实验情况下生理指标(清滤率、摄食率)的实测值;*W_e* 为实验贝软体部干重;*b* 为重量指数,取值 0.62^[27] 。

数据统计采用 SPSS13.0 进行单因素方差(ANOVA)分析,作图采用 EXCEL2003 。

2 结果

2.1 沉积再悬浮颗粒物对马氏珠母贝清滤率的影响

如图 1 所示,总悬浮颗粒物由低浓度(12.6 mg/L)趋高浓度(500 mg/L)时,马氏珠母贝的清滤率呈峰值变化。其中,在总悬浮颗粒物浓度为 50 mg/L 时,该贝清滤率达最大值(1.12 L · 个体⁻¹ · h⁻¹),随着总悬浮颗粒物浓度继续增加清滤率开始下降,其中,在悬浮颗粒物浓度为 500 mg/L 时,清滤率降为最小值(0.17 L · 个体⁻¹ · h⁻¹),清滤率降幅为 85% 。方差分析表明,水体中总悬浮颗粒物对马氏珠母贝清滤率影响极显著(*P*<0.01)。马氏珠母贝的清滤率(CR)与总悬浮颗粒物浓度(TPM)之间的线性函数关系为:

$$CR = -0.701 + 1.627 \times TPM - 0.463 \times TPM^2 + 0.036 \times TPM^3 \quad (R^2 = 0.928)$$

2.2 沉积再悬浮颗粒物对马氏珠母贝摄食率的影响

如图 2 所示,在总悬浮颗粒物浓度为 12.6—50 mg/L ,马氏珠母贝的摄食率随着总悬浮颗粒物浓度的升高而增加,在 50 mg/L 时达最大值(38.28 mg/h),当总悬浮颗粒物浓度超过 50 mg/L 时,摄食率反而下降,在总悬浮颗粒物浓度为 500 mg/L 时,降为最小值(16.22 mg/h),摄食率降幅为 58% 。方差分析表明,水体中总悬浮颗粒物对马氏珠母贝摄食率影响极显著(*P*<0.01)。马氏珠母贝类的摄食率(*IR*)与总悬浮颗粒物浓度(TPM)之间的线性函数关系为:

$$IR = -46.631 + 70.957 \times TPM - 18.385 \times TPM^2 + 1.367 \times TPM^3 \quad (R^2 = 0.907)$$

2.3 沉积再悬浮颗粒物对马氏珠母贝吸收率的影响

由图 3 可知,总悬浮颗粒物由低浓度(12.6 mg/L)趋高浓度(500 mg/L)时,马氏珠母贝的吸收率呈逐渐下降趋势。其中,在总悬浮颗粒物 12.6 mg/L 时,马氏珠母贝的吸收率最大(48.57%),而总悬浮颗粒物 500 mg/L 时,马氏珠母贝的吸收率最小(8.56%)。方差分析表明,水体中总悬浮颗粒物对马氏珠母贝吸收率影响极显著(*P*<0.01)。马氏珠母贝的吸收率(*AE*)与总悬浮颗粒物浓度(TPM)之间的线性函数关系为:

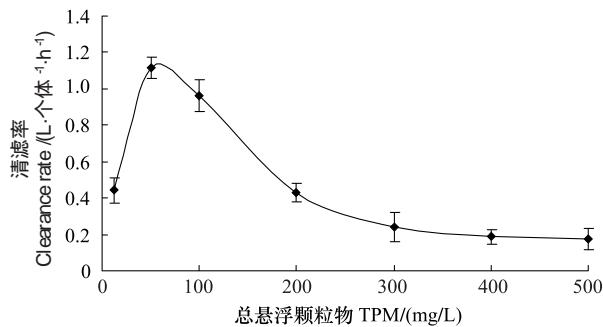

图 1 总悬浮颗粒物对马氏珠母贝清滤率的影响

Fig. 1 Effects of different suspended sediment concentration on the clearance rate of *Pinctada martensii*

$$AE = 52.189 + 0.132 \times TPM - 3.111 \times TPM^2 + 0.316 \times TPM^3 \quad (R^2 = 0.976)$$

3 讨论

中国沿海在夏季多风,沿海水域极易发生再悬浮^[28]。流沙湾位于湛江雷州半岛西南部,是中国“南珠”的主要养殖区,每年夏秋间常为大风暴的多发季节,风暴卷起海底泥沙易导致水体形成高浓度的悬浮颗粒物。水体中过多的泥沙颗粒会给滤食性贝类带来负面影响,如鳃丝损失、摄食量降低和增加对疾病的易感性等^[29]。本实验中作者采集马氏珠母贝筏式养殖区的表层底泥,按宋强等^[22]方法制备悬浮颗粒物,虽然烘干泥样中一些成分可能由于挥发或变性损失而与现场再悬浮颗粒物中某些组分略有差异,但是通过该方法制备悬浮颗粒物作为室内模拟研究是可行的。此外,选择9:00和21:00各进行1次实验,每次持续6 h,实验数据取两个时间点的平均值,以尽量减小昼夜摄食节律引起的实验误差。研究表明,水体中形成过高浓度的悬浮颗粒物对马氏珠母贝的清滤率、摄食率和吸收率产生了一定的负面效应,这与Ellis^[11]、宋强等^[22]的实验结果一致。

清滤率反映了贝类的滤水能力,是调节摄食行为的重要组成要素和获取能量的重要机制,其明显受到水体中食物数量和质量的影响^[30]。实验结果表明,在实验设置的悬浮颗粒物浓度范围内(12.6—500 mg/L),马氏珠母贝的清滤率随悬浮颗粒物浓度的增加而升高,当悬浮颗粒物浓度为50 mg/L时,该贝清滤率达最大值,然后,随着总悬浮颗粒物浓度继续增加,该贝清滤率开始下降。目前,国内外许多学者研究表明,在一定悬浮颗粒物浓度范围内,滤食性贝类的清滤率与悬浮颗粒物浓度呈正相关,而超过某一浓度,清滤率随悬浮颗粒物浓度的增加而下降。例如,Ellis^[11]、Barillé^[12]、Igesias^[19]的研究表明,当仅仅投喂自然沉积再悬浮颗粒物时,贝类的清滤率在60—100 mg/L范围内与总悬浮颗粒物浓度成正比;当浓度超过100 mg/L时,清滤率随浓度的增加而降低;宋强等^[22]研究表明,总悬浮颗粒物由低浓度趋高浓度时,栉孔扇贝、菲律宾蛤仔和紫贻贝3种滤食性贝类的清滤率均呈峰值变化。其中,栉孔扇贝和菲律宾蛤仔在50 mg/L时清滤率达到最大值,而紫贻贝在100 mg/L时清滤率达到最大值。本研究中,马氏珠母贝的清滤率在不同浓度悬浮颗粒物下呈现的峰值变化规律与上述研究结论相类似,而不同贝类在取得最大清滤率时的悬浮颗粒物浓度略有不同,说明不同贝类对悬浮颗粒物的耐受能力有差异,这可能与不同贝类的生活环境以及贝类自身的生理条件有关。与悬浮颗粒物浓度50 mg/L比较,当悬浮颗粒物浓度超过200 mg/L,马氏珠母贝清滤率降幅61.6%,在悬浮颗粒物浓度为500 mg/L时,清滤率降幅为85%。这是因为在高浓度悬浮颗粒物的水环境下,贝类受到环境胁迫,其生理和自身摄食机制受到限制,引起摄食减少和机体损伤,水体环境历史条件和贝类自身生理条件决定了贝类对悬浮颗粒物质量和数量潜在的摄食量^[31-32]。此外,水体中悬浮颗粒物浓度过高,增加的悬浮泥沙含量会明显增加假粪的产量和贝类能量的消耗,减少对食物的摄食并损伤贝类的鳃^[11]。

摄食率是反映滤食性贝类生理状况的一项动态指标,它直接受到贝类所处环境的生物和非生物因子的影

响,诸如海水的温度、盐度、流速、悬浮颗粒物的数量和质量等^[33]。本实验结果表明,水体中总悬浮颗粒物对马氏珠母贝摄食率影响极显著。在总悬浮颗粒物浓度为12.6—50 mg/L,马氏珠母贝的摄食率随着悬浮颗粒物浓度的升高而呈现峰值变化规律,其中,悬浮颗粒物为50 mg/L时清滤率达最大值,当总悬浮颗粒物浓度超过50 mg/L时,摄食率反而下降,在总悬浮颗粒物浓度为500 mg/L时,降为最小值。这与清滤率的变化趋势一致。与几种附着生活型的滤食性贝类比较表明,马氏珠母贝的最大摄食率与栉孔扇贝相似,而明显小于紫贻贝^[22],这可能与不同贝类的生活环境有关,马氏珠母贝和栉孔扇贝生活在透明度较大的海区^[34],而紫贻贝能长期生活在浊度较高的水体中,对不利环境的适应能力较强^[35]。与悬浮颗粒物浓度50 mg/L比较,当悬浮颗粒物浓度超过200 mg/L,马氏珠母贝摄食率降幅28.6%,在悬浮颗粒物浓度为500 mg/L时,摄食率降幅为58%。分析表明,在悬浮颗粒物浓度超过一定数值时,马氏珠母贝摄食率降低幅度小于清滤率,该贝摄食率受到的影响小于清滤率受到的影响。这是贝类为了维持正常的能量平衡和适应外界环境的变化,随水体中悬浮颗粒物浓度的增加,降低清滤率从而保持相对稳定的摄食率^[36]。滤食性贝类通过摄食有机物质和选择性排出假粪来适应水体中悬浮颗粒物质量和数量的变化^[37],在高浓度悬浮颗粒物情况下,通过调节摄食率,降低清滤率可防止颗粒物过多地滞留于鳃上,这是对不良条件的一种反应^[8]。

关于悬浮颗粒物对吸收率的影响研究已经有了相关报道。许多学者对硬壳蛤(*Mercenaria mercenaria*)^[38]和欧洲鸟尾蛤^[19]以及栉孔扇贝、紫贻贝和菲律宾蛤仔^[22]的研究结果表明,随着悬浮颗粒物浓度的增高,水体中有机质的含量降低,贝类对再悬浮颗粒物的吸收效率也降低。在本实验中,水体中总悬浮颗粒物浓度对马氏珠母贝吸收率影响极显著,总悬浮颗粒物由低浓度(12.6 mg/L)趋高浓度(500 mg/L)时,马氏珠母贝的吸收率呈逐渐下降趋势,这可能由于实验水槽中总悬浮颗粒物浓度增加而沉积速率增大,有机物通过吸附等原因使其比例减少,进而对再悬浮颗粒物的吸收效率也降低。本研究结果支持了上述研究结论。MacDonald等^[21]对海螂和麦哲伦扁圆扇贝(*Placopecten magellanicus*)的研究结果表明,随着总悬浮颗粒物的质量(颗粒物中有机物含量)的增加,这两种贝类的吸收率都有明显的增加。可以看出,在贝类的吸收率和饵料的质量(饵料中有机物的含量)之间有着很密切的关系。因此,可以利用这一关系来增加海区饵料中有机物的含量,从而达到增加海区马氏珠母贝养殖容量的目的。

Screening of growth decline related genes from *Alexandrium catenella* ZHONG Jie, SUI Zhenghong, WANG Chunyan, et al (431)
Analysis of inherent optical properties of Lake Taihu in spring and its influence on the change of remote sensing reflectance LIU Zhonghua, LI Yunmei, LU Heng, et al (438)
Neural network modeling of the eutrophication mechanism in Lake Chenghai and corresponding scenario analysis ZOU Rui, DONG Yunxian, ZHANG Zhenzhen, et al (448)
The compensatory growth of shrubby *Pinus thunbergii* response to the boring stress in sandy coast ZHOU Zhen, LI Chuanrong, XU Jingwei, et al (457)
Selected body temperature and thermal tolerance of tadpoles of two frog species (*Fejervarya limnocharis* and *Microhyla ornata*) acclimated under different thermal conditions SHI Linqiang, ZHAO Lihua, MA Xiaohao, et al (465)
Effects of landscape structure and key landscape factors on aphids-parasitoids-hyper parasitoids populations in wheat fields ZHAO Zihua, WANG Ying, HE Dahan, et al (472)
Effects of cadmium on lipid peroxidation and ATPase activity of plasma membrane from Chinese kale (*Brassica alboglabra* Bailey) roots ZHENG Aizhen (483)
Effects of ginger aqueous extract on soil enzyme activity, microbial community structure and soil nutrient content in the rhizosphere soil of ginger seedlings HAN Chunmei, LI Chunlong, YE Shaoping, et al (489)
Manganese tolerance and accumulation in mycelia of *Cordyceps kyusyuensis* LUO Yi, CHENG Xianhao, ZHANG Congcong, et al (499)
Influence of oxytetracycline exposure on antibiotic resistant bacteria and enzyme activities in wheat rhizosphere soil ZHANG Hao, ZHANG Lilan, WANG Jia, et al (508)
Effects of elevated nitrogen deposition on soil organic carbon mineralization and soil enzyme activities in a Chinese fir plantation SHEN Fangfang, YUAN Yinghong, FAN Houbao, et al (517)
Differences in clonal growth between female and male plants of *Rhus typhina* Linn. and their diurnal changes in photosynthesis and chlorophyll fluorescence ZHANG Mingru, WEN Guosheng, ZHANG Jin, et al (528)
Soil water holding capacity under four typical ecosystems in Wuyunjie Nature Reserve of Hunan Province PAN Chunxiang, LI Yuyuan, PENG Yi, et al (538)
The effect of different land use patterns on soil properties in alpine areas of eastern Qilian Mountains ZHAO Jinmei, ZHANG Degang, LIU Changzhong, et al (548)
Responses of soil macro-fauna to land desertification in sandy grassland LIU Rentao, ZHAO Halin (557)
Characteristics of cultivable microbial community number and structure at the southeast edge of Tengger Desert ZHANG Wei, ZHANG Gaosen, LIU Guangxiu, et al (567)
Physiological and ecological responses of maize to different severities of desertification in the Southern Taklamakan desert LI Lei, LI Xiangyi, LIN Lisha, WANG Yingju, et al (578)
Characterization of caloric value in fifteen plant species in *Leymus chinensis* steppe in Xilin River Basin, Inner Mongolia GAO Kai, XIE Zhongbing, XU Sutie, et al (588)
Spatial pattern responses of *Achnatherum splendens* to environmental stress in different density levels ZHANG Mingjuan, LIU Maosong, XU Chi, et al (595)
Effects of environmental factors on species distribution and diversity in an *Abies fargesii-Betula utilis* mixed forest REN Xuemin, YANG Gaihe, WANG Dexiang, et al (605)
Effects of alginate cerium complexes on ascorbate- glutathione cycle in spinach leaves under chlorpyrifos stress LUAN Xia, CHEN Zhende, WANG Dongfeng, et al (614)
Analysis on spatiotemporal changes of urban thermal landscape pattern in the context of urbanisation: a case study of Xiamen City HUANG Jucong, ZHAO Xiaofeng, TANG Lina, et al (622)
The analysis of the green vegetation cover change in western Sichuan based on GIS and Remote sensing YANG Cunjian, ZHAO Zijian, REN Xiaolan, et al (632)
An inventory of BVOC emissions for a subtropical urban-rural complex: Greater Taizhou Area CHANG Jie, REN Yuan, SHI Yan, et al (641)
Scientific Note
Litter decomposition and nutrient dynamics of *Carex lasiocarpa* under different water conditions HOU Cuicui, SONG Changchun, LI Yingchen, et al (650)
Nest-box color preference and reproductive success of great tit ZHANG Keqin, DENG Qiuxiang, Justin Liu, et al (659)

《生态学报》2012 年征订启事

《生态学报》是中国生态学学会主办的自然科学高级学术期刊,创刊于 1981 年。主要报道生态学研究原始创新性科研成果,特别欢迎能反映现代生态学发展方向的优秀综述性文章;研究简报;生态学新理论、新方法、新技术介绍;新书评介和学术、科研动态及开放实验室介绍等。

《生态学报》为半月刊,大 16 开本,280 页,国内定价 70 元/册,全年定价 1680 元。

国内邮发代号:82-7 国外邮发代号:M670 标准刊号:ISSN 1000-0933 CN 11-2031/Q

全国各地邮局均可订阅,也可直接与编辑部联系购买。欢迎广大科技工作者、科研单位、高等院校、图书馆等订阅。
