摘要:文化林是指村民按照文化传统、风俗习惯或宗教信仰自觉保护和管理的森林,具有一定社会文化功能。目前国内外对文化林物种多样性研究主要为定性描述,缺乏对文化林和非文化林生物多样性的定量比较及差异来源分析。利用物种多样性加性分配方法,将总的 Gamma 多样性分成样格内的 Alpha 多样性以及样格间、样方间和林型间 Beta 多样性,对中国亚热带地区 3 个村落文化林的乔木层、灌木层、草本层和藤本层进行物种多样性的多尺度分析。调查发现:(1)文化林共有维管束植物 296 种,以苦槠、樟和米槠为优势种,非文化林共有维管束植物 189 种,以杉木、马尾松和毛竹为优势种。文化林乔木层和灌木层物种数显著高于非文化林,草本层和藤本层物种数差异不显著。(2)Beta 多样性随尺度增大而增加,林型间 Beta 多样性最高,占区域总 Gamma 多样性的 41.9%—62.8%,其次是样方间 Beta 多样性(18.6%—31.9%),对区域多样性贡献最小为样格内 Alpha 和样格间 Beta 多样性。(3)林型间的多样性对区域物种多样性的贡献中,文化林占主导作用,乔木层占 54.4%—81.0%,灌木层占 51.2%—60.2%,草本层占 42.9%—64.1%,藤本层占 49.9%—62.2%。(4)物种累积-面积曲线表明,在各个尺度上,文化林物种多样性始终高于非文化林,从而在相同面积下保护了更多的物种。加性分配模型在多个空间尺度上阐明了 Alpha 和 Beta 多样性的变化,突出了文化林对区域物种多样性的贡献,对保护对象和保护范围的决策以及生物多样性的保护与恢复具有重要意义。

关键词:文化林; 物种多样性; 加性分配; Beta 多样性

Additive partition of species diversity across multiple spatial scales in community culturally protected forests and non-culturally protected forests

State Key Laboratory of Urban and Regional Ecology, Research Center for Eco-Environmental Sciences, Chinese Academy of Sciences, Beijing 100085, China

Abstract: Culturally protected forests, which are preserved and managed by local people on the basis of traditional cultural practices and beliefs, have certain social and ecological functions, and also show significant role in biodiversity conservation. The research worldwide nowadays mainly focuses on qualitative description of culturally protected forests and therefore lack quantitative comparison of biodiversity and difference in species composition between culturally protected forests and non-culturally protected forests, particularly diversity from different spatial scales. The tree layer, shrub layer, herb layer and vine layer of three culturally protected forests and non-culturally protected forests were investigated, using additive partition measured by species abundance to analyze diversity of multi-scale in subtropical region of China. Partitioning of total species diversity can be described as Alpha diversity (within grid diversity) + Beta diversity = Gamma diversity (total diversity at landscape), among which Beta diversity could be divided into diversity between grids, diversity between plots, diversity between forest types. The results were: (1) Total 296 species belonging to 66 families and 163 genera were found in culturally protected forests, dominated by *Castanopsis sclerophylla*, *Cinnamomum camphora* and

Castanopsis carlesii, while 189 species belonging to 67 families and 135 genera were found in non-culturally protected forests, dominated by *Cunninghamia lanceolata*, *Pinus massoniana* and *Phyllostachys heterocycla* cv. *pubescens*. Culturally protected forests had more species in tree layer and shrub layer although the differences of species composition were complex in herb and vine layer depending on human disturbance and locations, and most of species diversity was higher in culturally protected forests. (2) This model implied that Beta diversity was increasing at larger spatial scale, and which showed uniform results in different layers in both culturally protected forests and non-culturally protected forests. Additive partitioning of diversity between forest types was highest which was from 41.9% to 62.8% of total diversity at landscape level, followed by diversity between plots which was from 18.6% to 31.9%, the contribution of diversity within and between grids was only small proportion. (3) Culturally protected forests play dominant role in partitioning of diversity between forests types, and provided 54.4% to 81.0%, 51.2% to 60.2%, 42.9% to 64.1%, 49.9% to 62.2% of total diversity in culturally protected forests and non-culturally protected forests in tree, shrub, herb and vine layers respectively. That means culturally protected forests act as species pool to the regional area, particularly in conservation of tree species. (4) Species accumulation curves of tree layer achieved smooth slower indicating larger number stands protected in culturally protected forests than non-culturally protected forests within the same sample area. Additive partitioning of species diversity offers an operational method for explaining species diversity and in terms of better understanding of how alpha and Beta diversity change across multiple spatial scales. The model suggests culturally protected forests could be key factor to make contribution for diversity at landscape level. Therefore, when making biodiversity protection and restoration strategies, it's better to focus more on culturally protected forests. However, the impact of human disturbance to culturally protected forests still needs to be studied in depth.

Key Words: culturally protected forests; species diversity; additive partitioning; Beta diversity

文化林是指村民按照文化传统、风俗习惯或宗教信仰自觉保护和管理的森林,文化林具有一定社会文化功能,多数分布在我国农村地区,被持续保护了几十、几百甚至上千年。很多学者指出,利用文化传统和宗教信仰对生物多样性的保护比仅依靠法规政策的保护可能更有利于可持续发展^[1-4]。国外学者对文化林例如神山,圣地的资源保护功能关注较多^[5-8]。我国学者对文化林的研究以少数民族地区居多,如西南地区少数民族的神山^[9-12]、民族传统文化^[13-15]和传统知识^[16-17]对生物多样性的保护和自然资源的管理,也有研究指出文化林的生物多样性较高^[18-19]。但对文化林群落的分析相对较少,尤其是物种多样性的尺度来源未见报道。

生物多样性与尺度密切相关,利用加性分配方法,即 $\text{Beta} = \text{Gamma} - \text{Alpha}$ ^[20],可以在多个尺度上,将村落周边森林群落总的生物多样性(Gamma)分解为最小取样单元内的 Alpha 多样性,和多个空间尺度和森林类型上的 Beta 多样性。在加性模型中,Alpha、Beta 和 Gamma 多样性的表达方式相同,单位相同,可以直接进行比较,能跨尺度解释 Alpha 和 Beta 多样性对区域总的 Gamma 多样性的贡献和来源^[21-24]。因此广泛应用于物种多样性在空间尺度上的保护^[25-27],能更好地说明多样性与尺度的关系以及各个不同尺度对多样性保护的影响。

物种累积-面积曲线描述物种数目随取样面积增加而增长的趋势^[28],一般用幂函数进行拟合^[29]。物种-面积关系的尺度效应以及区域差异对生物多样性估算和评价具有重要价值,如群落类型、物种类群和土地利用方式都会影响物种累积——面积曲线^[30-31]。这样,就可以根据物种数目随面积增加而增长的速率,在各个空间尺度上评价文化林和非文化林的物种多样性^[32]。

本研究以我国南方3个村落文化林为研究对象,与周围面积最大最典型的森林类型作为非文化林进行比较,在进行系统取样后,运用生物多样性加性分配模型和物种累积-面积曲线,在多个空间尺度上进行分析:(1)文化林与非文化林物种组成的差异;(2)文化林与非文化林对区域物种多样性的贡献;(3)不同尺度对区域物种多样性的贡献大小。明确文化林在物种保护中的作用,为生物多样性保护范围与目标的确定提供

参考。

1 研究区域与研究方法

1.1 研究区域

本研究调查了福建、江西两省3个村落的文化林(表1)。其中,龙岩市属亚热带海洋性季风气候,上饶市属中亚热带湿润型气候,两地均气候温暖,光照充足,雨量充沛,无霜期长。

表1 调查区域自然属性

Table 1 Natural attributes of the study area

年降雨量 Annual precipitation/mm	1031—1369	1600—1800	1600—1800
海拔 Altitude/m	348—490	87—130	128—185
坡度 Slope/(°)	15—40	5—35	8—40

1.2 样方设置

文化林为天然林,干扰轻微,面积从0.3 hm²到9 hm²不等,均属集体林。在每个村庄的文化林中随机选取5个20 m×20 m的标准样地,每个标准地内均匀划分4个10 m×10 m的样格,记录样方中乔木层树木种类、数量、胸径($DBH \geq 3\text{cm}$)和树高,并记录每个样方中的藤本植物。在每个乔木样格中,随机设置1个5 m×5 m的小样格,调查灌木(含乔木的更新苗)种类、数量、冠幅和平均高度。同样,随机设置1个1 m×1 m的小样格,调查其草本的种类、数量和盖度。同时还记录了样地海拔、坡度、坡向、经纬度和干扰程度等。以每个村庄周围最典型面积最大森林类型作为非文化林进行对比,调查方法同上。其中,汾水和龙潭村为天然次生林,而江湾村为人工林,干扰较重。共调查了120个10m×10m的乔木样格,120个5m×5m的灌木样格,120个1m×1m的草本样格。

1.3 数据分析

1.3.1 重要值计算

用重要值来判定群落中的优势物种,重要值=($a+b+c$)/3。式中a为相对密度=一个种的密度/所有种的密度×100%;b为相对优势度=某一种的基面积之和/全部种的基面积之和×100%;c为相对频度=一个种的频度/所有种的频度×100%。上述公式中,乔木层相对优势度用胸高断面面积计算,灌木层优势度用冠幅来计算,草本层则用盖度计算^[33]。物种丰富度的统计分析采用SPSS18.0软件(双因素方差)实现。

1.3.2 生物多样性加性分配模型

本研究用多样性加性分配模型来计算不同层次上的多样性。其中,Alpha为样格内多样性,Beta多样性即样格间Beta多样性、样方间Beta多样性和林型间Beta多样性,总的Gamma多样性,等于最小尺度的Alpha多样性加上每一尺度的Beta多样性,即区域物种多样性等于样格内Alpha多样性+样格间Beta多样性+样方间Beta多样性+林型间Beta多样性(图1)。

1.3.3 物种面积累积曲线

为了估算文化林、非文化林以及整个区域的物种数目,本文用面积相同的样格(10m×10m)随机组合,进行

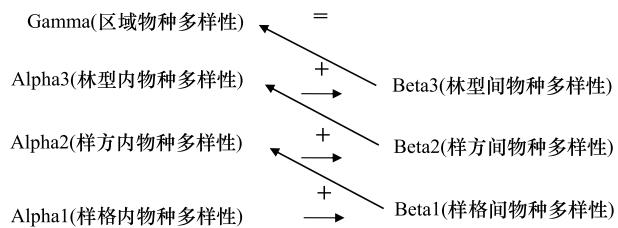

图1 物种多样性加法分配法则划分不同尺度的物种多样性组分关系

Fig. 1 Schematic representation of the different hierarchical scales according to additive partitioning of biodiversity

物种累加,面积大小从 100m^2 累积到 2000 m^2 。软件 EstimateS Win8.20^[34]实现选择随机样格中物种数目的各种组合,获取样格组系列,得到物种面积累积关系,用幂函数拟合关系最好。

2 结果

2.1 文化林与非文化林的群落结构

文化林群落完整,种类丰富,一般处于演替顶级或后期。三个文化林共有维管束植物296种,属于66科,163属,以樟科(Lauraceae, 22种)、壳斗科(Fagaceae, 16种)和山茶科(Theaceae, 15种)为主。非文化林中共有维管束植物189种,属于67科,135属,以壳斗科(17种)、大戟科(Euphorbiaceae, 13种)、禾本科(Gramineae, 13种)为主。文化林物种数显著高于非文化林,其中乔木层差异最大($P=0.000$),灌木层、草本层和藤本层无显著差异($P>0.05$)。

文化林乔木层包括了更多的物种,以苦槠(*Castanopsis sclerophylla*)、樟(*Cinnamomum camphora*)和米槠(*Castanopsis carlesii*)为优势种(附录),非文化林则以毛竹(*Phyllostachys carlesii* cv. *pubescens*)、杉木(*Cunninghamia lanceolata*)、马尾松(*Pinus sylvestris lan*)为主。在3个调查区中,乔木层物种多样性最高为汾水村48种,非文化林只有40种。其次江湾村40种,非文化林10种。最低为龙潭村34种,非文化林为27种。

灌木层物种丰富度,文化林也相对高于非文化林,并以油茶(*Camellia oleifera*)、木荷(*Schima superba*)、紫金牛(*Ardisia superba*)为优势种,非文化林则以苦竹(*Pleioblastus amarus*)、茶(*Camellia sinensis*)为主。灌木层物种多样性,汾水村调查中发现87个物种,非文化林有58个物种。龙潭村文化林灌木层物种多样性为75种,非文化林为66种。江湾村文化林灌木层多样性为58个物种,非文化林有57个物种。

除了龙潭村之外,江湾村和汾水村的草本层物种丰富度也高于非文化林,物种组成上差异较小。文化林草本层共有29个物种,非文化林有16个物种。龙潭村文化林草本层包含26个物种,非文化林有34个物种。汾水村的文化林草本层包含15个物种,非文化林包含14个物种。

藤本层多样性龙潭村文化林物种丰富度为40种,非文化林为41种。江湾村文化林藤本层有32种,非文化林有20种。汾水村的文化林藤本层有25种藤本植物,非文化林只有19种。

2.2 不同尺度下文化林与非文化林的加性分配

相对非文化林来说,文化林乔木层对区域乔木层物种多样性的贡献为54.4%,81.0%,59.0%。从4个尺度来看,在3个区域的两种林型中,不同尺度对区域物种多样性的贡献,除江湾村非文化林呈现Beta3>Beta2>Alpha1>Beta1,其余均呈现一致的结果:Beta3>Beta2>Beta1>Alpha1。林型间多样性贡献较大,占区域总Gamma多样性的54.6%—62.8%,样方间多样性贡献居其次,占区域总多样性的18.6%—22.7%(图2)。

相对非文化林来说,文化林灌木层对区域物种多样性的贡献为51.2%,53.8%,55.2%。从4个尺度来看,在3个区域的两种林型中,不同尺度对区域物种多样性贡献,一半呈现Beta3>Beta2>Beta1>Alpha1,另一半为Beta3>Beta2>Alpha1>Beta1。林型间多样性占区域总多样性的41.9%—53.9%,样方间多样性占区域总多样性的23.1%—29.0%(图3)。

文化林草本层对区域物种多样性的贡献为64.1%,42.9%,53.2%。从4个尺度来看,在3个区域的两种林型中,不同尺度对区域物种多样性贡献,江湾村非文化林和汾水村文化林物种多样性贡献为Beta3>Beta2>Alpha1>Beta1,其余的均为Beta3>Beta2>Beta1>Alpha1。林型间多样性占区域总多样性的53.2%—56.5%,样方间多样性占区域总多样性的21.7%—23.4%(图4)。

文化林藤本层对区域物种多样性的贡献为62.2%,54.8%,49.9%。从4个尺度来看,在3个区域的两种林型,不同尺度对区域物种多样性贡献为,江湾村文化林 Beta3>Beta2>Alpha1>Beta1,其余的均为 Beta3>Beta2>Beta1>Alpha1。林型间多样性占区域总多样性的50.8%—57.5%,样方间多样性占区域总多样性的21.3%—24.6%(图5)。

2.3 物种累积-面积曲线

通过随机选择面积相同的样格中物种的组合来建立物种数目随面积增加的累计曲线,得到文化林与非文

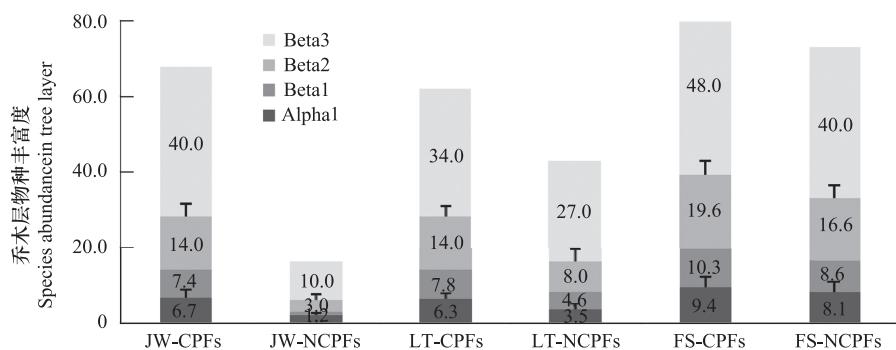

图2 村落文化林与非文化林乔木层物种丰富度的加性分配

Fig. 2 Additive partitioning of species abundance of tree layer in community culturally protected forests and non-culturally protected forests

Alpha:样格内物种多样性,Beta1:样格间多物种多样性,Beta2:样方间物种多样性,Beta3:林型间物种多样性;LT:龙潭,FS:汾水,JW:江湾,CPFs:文化林,NCPFs:非文化林

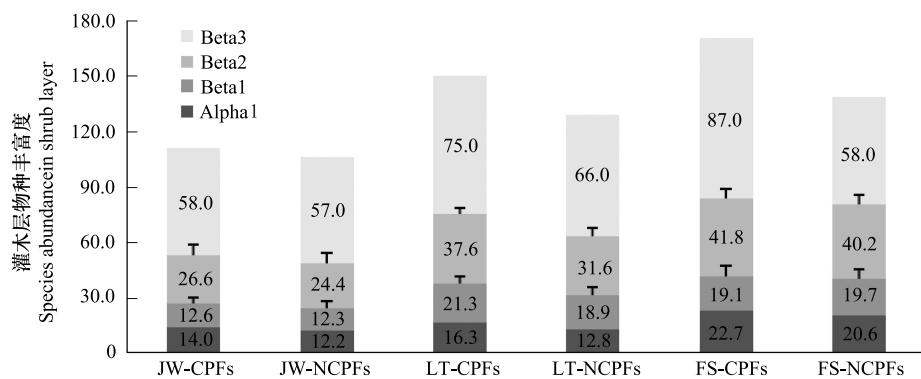

图3 村落文化林与非文化林灌木层物种丰富度的加性分配

Fig. 3 Additive partitioning of species abundance of shrub layer in community culturally protected forests and non-culturally protected forests

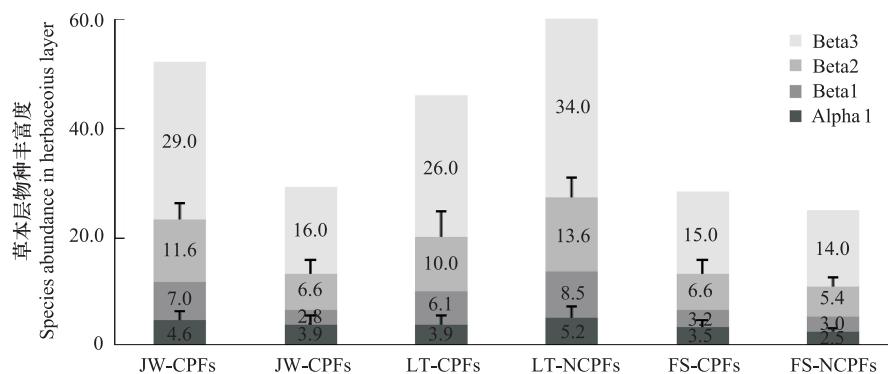

图4 村落文化林与非文化林草本层物种丰富度的加性分配

Fig. 4 Additive partitioning of species abundance of herbaceous layer in community culturally protected forests and non-culturally protected forests

化林乔木层保护的物种数。龙潭村物种累计曲线随面积增大逐渐平滑,汾水村物种累计曲线随面积增大已达到平滑,江湾村物种累积曲线随面积增加增长缓慢,可以用来估测文化林在区域尺度保护物种数目。相同面积下,文化林物种数随着面积的增加始终大于非文化林(图6),并且非文化林比文化林先达到了平滑,并增长

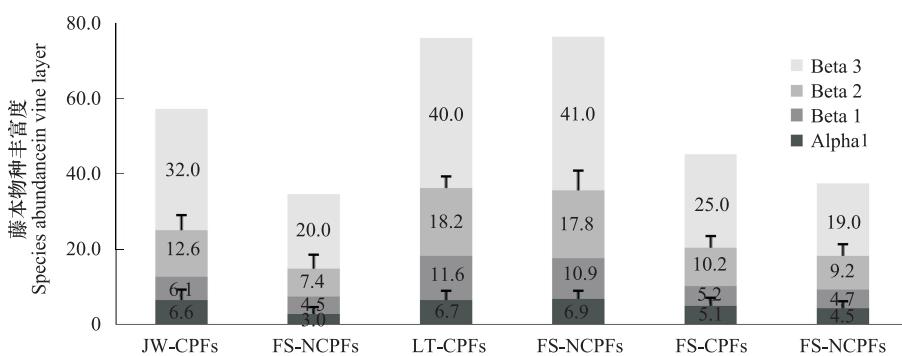

图5 村落文化林与非文化林藤本物种丰富度的加性分配

Fig. 5 Additive partitioning of species abundance of vine layer in community culturally protected forests and non-culturally protected forests

缓慢,说明相同面积下文化林中物种种类较多。

Fig. 6 Species accumulation curve of tree layer in Longtan, Fenshui, Jiangwan culturally protected forests and non-culturally protected forests

3 讨论

文化林面积不大,但多样性较丰富,在保护区域物种多样性方面起到了重要的作用。文化林中的乔木层

以苦槠、樟、米槠为优势种,非文化林则以杉木、马尾松、毛竹等为主,说明文化林保存了多数的本土阔叶树种,而非文化林的乔木层逐渐被造林树种取代。灌木层多以油茶、木荷、紫金牛为优势种,而非文化林则以苦竹、茶、櫟木为主。文化林与非文化林的草本层和藤本层的主要优势物种组成差异较小,部分文化林的物种较多,由于文化林群落位于村落周边,草本层受人畜干扰相对较严重。文化林的乔木层、灌木层、草本层和藤本层的物种多样性在区域尺度上,除龙潭村草本层、藤本层等之外,均高于非文化林,草本层和藤本层受干扰影响较大。总的来说,文化林维持了天然林的原始风貌,并且保护了一定本土物种,而非文化林乔灌层受到干扰较大,优势物种由阔叶树种为主转成以针叶树种为主,并且物种数相对较少。

加性分配对区域物种多样性的贡献为文化林乔木层占 54.4%—81.0%,灌木层占 51.2%—55.2%,草本层占 42.9%—64.1%,藤本层占 49.9%—62.2%,文化林对区域总的物种多样性的贡献起到了主导作用,扮演着区域物种库的角色,尤其在保护乔木层物种方面。通过物种累积—面积曲线,对文化林与非文化林乔木层的物种数目进行评价,发现相同取样面积下文化林物种丰富度始终大于非文化林,文化林在相同面积下可以保护更多的物种。

从不同的尺度的分析文化林在区域物种多样性保护中的作用,为理解文化林的贡献和保护提供重要参考。通过对不同尺度的物种丰富度,表明随着尺度的增大,Beta 多样性也增大,也反应了 Beta 多样性对每个尺度的环境异质性的响应,异质性越高,多样性越大^[35]。对区域物种多样性的贡献,最大来自林型间多样性(Beta3),其次是样方间多样性(Beta2)大于样格间多样性(Beta1)或者样格内多样性(Alpha1),林型间多样性对区域多样性的贡献为 41.9%—62.8%,说明林型间多样性是度量区域多样性的合适尺度^[22],并且具有较高的物种多样性和更替速率。相对非文化林来说,文化林的 Beta 多样性较高,因此在考虑保护或恢复生态系统的时候,主要应集中于保护文化林区域。由于文化林离村落很近,人为活动对多样性的影响有待进一步研究,另外,Kattan^[36]森林破碎化也可以增加 Beta 多样性。生物多样性的加性分配法则为生物多样性的多尺度研究不同组分关系的变化提供了有效地理论框架,可以广泛应用于空间尺度、时间尺度、组织尺度等^[37-39],有效地帮助进行保护决策。

致谢:感谢 Wageningen 大学环境政策组(荷兰)以及中国科学院生态环境研究中心城市与区域生态国家重点实验室,龙岩学院孔祥海教授、婺源林业局洪元华站长、厦门大学硕士研究生巫渭欢、张文超、李远智等在样方调查过程中给予的帮助。

ACTA ECOLOGICA SINICA Vol. 32, No. 21 November, 2012 (Semimonthly)

CONTENTS

Widespread of anaerobic ammonia oxidation bacteria in an eutrophic freshwater lake wetland and its impact on nitrogen cycle	WANG Shanyun, ZHU Guibing, QU Dongmei, et al (6591)
Responds of soil enzyme activities of degraded coastal saline wetlands to irrigation with treated paper mill effluent	XIA Mengjing, MIAO Ying, LU Zhaohua, et al (6599)
Wetland ecosystem health assessment of the Tumen River downstream	ZHU Weihong, GUO Yanli, SUN Peng, et al (6609)
An index of biological integrity: developing the methodology for assessing the health of the Baiyangdian wetland	CHEN Zhan, LIN Bo, SHANG He, et al (6619)
MODIS-based analysis of wetland area responses to hydrological processes in the Dongting Lake	LIANG Jie, CAI Qing, GUO Shenglian, et al (6628)
The diversity of invasive plant <i>Spartina Alterniflora</i> rhizosphere bacteria in a tidal salt marshes at Chongming Dongtan in the Yangtze River estuary	ZHANG Zhengya, DING Chengli, XIAO Ming (6636)
Analyzing the azimuth distribution of tree ring $\delta^{13}\text{C}$ in subtropical regions of eastern China using the harmonic analysis	ZHAO Xingyun, LI Baohui, WANG Jian, et al (6647)
In the process of grassland degradation the spatial pattern and spatial association of dominant species	GAO Fuyuan, ZHAO Chengzhang (6661)
Activities of soil oxidoreductase and their response to seasonal freeze-thaw in the subalpine/alpine forests of western Sichuan	TAN Bo, WU Fuzhong, YANG Wanqin, et al (6670)
Simulating the effects of forestry classified management on forest biomass in Xiao Xing'an Mountains	DENG Huawei, BU Rencang, LIU Xiaomei, et al (6679)
The simulation of three-dimensional canopy net photosynthetic rate of apple tree	GAO Zhaoquan, ZHAO Chenxia, ZHANG Xianchuan, et al (6688)
The effect of <i>Phomopsis</i> B3 and organic fertilizer used together during continuous cropping of strawberry (<i>Fragaria ananassa</i> Duch)	HAO Yumin, DAI Chuanchao, DAI Zhidong, et al (6695)
Temporal and spatial variations of DOC, DON and their function group characteristics in larch plantations and possible relations with other physical-chemical properties	SU Dongxue, WANG Wenjie, QIU Ling, et al (6705)
Comparisons of quantitative characteristics and spatial distribution patterns of <i>Eremosparton songoricum</i> populations in an artificial sand fixed area and a natural bare sand area in the Gurbantunggut Desert, Northwestern China	ZHANG Yongkuan, TAO Ye, LIU Huiliang, et al (6715)
Comparison study on macroinvertebrate assemblage of riffles and pools:a case study of Dong River in Kaixian County of Chongqing, China	WANG Qiang, YUAN Xingzhong, LIU Hong (6726)
Nekton community structure and its relationship with main environmental variables in Lidao artificial reef zones of Rongcheng	WU Zhongxin, ZHANG Lei, ZHANG Xiumei, et al (6737)
Zooplankton diversity and its variation in the Northern Yellow Sea in the autumn and winter of 1959, 1982 and 2009	YANG Qing, WANG Zhenliang, FAN Jingfeng, et al (6747)
Building ecological security pattern based on land use;a case study of Ordos, Northern China	MENG Jijun, ZHU Likai, YANG Qianet al (6755)
Additive partition of species diversity across multiple spatial scales in community culturally protected forests and non-culturally protected forests	GAO Hong, CHEN Shengbin, OUYANG Zhiyun (6767)
Environmental perception of farmers of different livelihood strategies: a case of Gannan Plateau	ZHAO Xueyan (6776)
Application and comparison of two prediction models for groundwater dynamics	ZHANG Xia, LI Zhanbin, ZHANG Zhenwen, et al (6788)
Pollination success of <i>Phaius delavayi</i> in Huanglong Valley, Sichuan	HUANG Baoqiang, KOU Yong, AN Dejun (6795)
Mechanism of nitrification inhibitor on nitrogen-transformation bacteria in vegetable soil	YANG Yang, MENG Denglong, QIN Hongling, et al (6803)
Archaea diversity in water of two typical brackish lakes in Xinjiang	DENG Lijuan, LOU Kai, ZENG Jun, et al (6811)
Abundance and biomass of heterotrophic flagellates in Baiyangdian Lake, as well as their relationship with environmental factors	ZHAO Yujuan, LI Fengchao, ZHANG Qiang, et al (6819)
Effects of bisphenol A on the toxicity and life history of the rotifer <i>Brachionus calyciflorus</i>	LU Zhenghe, ZHAO Baokun, YANG Jiaxin (6828)
Effect of incubation temperature on behavior and metabolism in the Chinese cornsnake, <i>Elaphe bimaculata</i>	CAO Mengjie, ZHU Si, CAI Ruoru, et al (6836)
Functional and numerical responses of <i>Mallada besalis</i> feeding on <i>Corypha cephalonica</i> eggs	LI Shuiquan, HUANG Shoushan, HAN Shichou, et al (6842)
Stability analysis of mutualistic-parasitic coupled system	GAO Lei, YANG Yan, HE Junzhou, et al (6848)
Effect of ultra-micro powder qiweibaishusan on the intestinal microbiota and enzyme activities in mice	TAN Zhoujin, WU Hai, LIU Fulin, et al (6856)
Review and Monograph	
The effects of nitrogen deposition on forest carbon sequestration:a review	CHEN Hao, MO Jiangming, ZHANG Wei, et al (6864)
Effect of enhanced CO ₂ level on the physiology and ecology of phytoplankton	ZHAO Xuhui, KONG Fanxiang, XIE Weiwei, et al (6880)
Transboundary protected areas as a means to biodiversity conservation	SHI Longyu, LI Du, CHEN Lei, et al (6892)
Scientific Note	
The energy storage and its distribution in 11-year-old chinese fir plantations in Huitong and Zhuting	KANG Wenxing, XIONG Zhengxiang, HE Jienan, et al (6901)
Spatial pattern of sexual plants and vegetative plants of <i>Stipa krylovii</i> population in alpine degraded grassland	REN Heng, ZHAO Chengzhang, GAO Fuyuan, et al (6909)

《生态学报》2013 年征订启事

《生态学报》是中国生态学学会主办的生态学专业性高级学术期刊,创刊于 1981 年。主要报道生态学研究原始创新性科研成果,特别欢迎能反映现代生态学发展方向的优秀综述性文章;研究简报;生态学新理论、新方法、新技术介绍;新书评介和学术、科研动态及开放实验室介绍等。

《生态学报》为半月刊,大 16 开本,300 页,国内定价 90 元/册,全年定价 2160 元。

国内邮发代号:82-7,国外邮发代号:M670

标准刊号:ISSN 1000-0933 CN 11-2031/Q

全国各地邮局均可订阅,也可直接与编辑部联系购买。欢迎广大科技工作者、科研单位、高等院校、图书馆等订阅。

通讯地址:100085 北京海淀区双清路 18 号 电 话:(010)62941099; 62843362
