第34卷 第1期 2014年1月 (半月刊)

目 次

卷首语：复杂与永续..... (I)

前沿理论与学科综述

- 城市复合生态及生态空间管理 王如松, 李 锋, 韩宝龙, 等 (1)
海洋生态系统固碳能力估算方法研究进展 石洪华, 王晓丽, 郑 伟, 等 (12)
城市生态系统灵敏度模型评述 姚 亮, 王如松, 尹 科, 等 (23)
城市生活垃圾代谢的研究进展 周传斌, 徐琬莹, 曹爱新 (33)

个体与基础生态

- 胶州湾生物-物理耦合模型参数灵敏度分析 石洪华, 沈程程, 李 芬, 等 (41)
渤海湾大型底栖动物调查及与环境因子的相关性 周 然, 覃雪波, 彭士涛, 等 (50)
生物扰动对沉积物中污染物环境行为的影响研究进展 覃雪波, 孙红文, 彭士涛, 等 (59)

种群、群落和生态系统

- 密云水库上游流域生态系统服务功能空间特征及其与居民福祉的关系 王大尚, 李屹峰, 郑 华, 等 (70)
长岛自然保护区生态系统维护的条件价值评估 郑 伟, 沈程程, 乔明阳, 等 (82)
海岛陆地生态系统固碳估算方法 王晓丽, 王 媛, 石洪华, 等 (88)

景观、区域和全球生态

- 区域生态文明建设水平综合评估指标 刘某承, 苏 宁, 伦 飞, 等 (97)
基于生境质量和生态响应的莱州湾生态环境质量评价 杨建强, 朱永贵, 宋文鹏, 等 (105)
1985年以来黄河三角洲孤东海岸演变与生态损益分析 刘大海, 陈小英, 徐 伟, 等 (115)
基于复合生态系统理论的海洋生态监控区区划指标框架研究 徐惠民, 丁德文, 石洪华, 等 (122)
我国环境功能评价与区划方案 王金南, 许开鹏, 迟妍妍, 等 (129)

资源与产业生态

- 生态产业园的复合生态效率及评价指标体系 刘晶茹, 吕 彬, 张 娜, 等 (136)
我国农业生态效率的时空差异 程翠云, 任景明, 王如松 (142)
内蒙古半干旱生态脆弱矿区生态修复耦合机理与产业模式 陈玉碧, 黄锦楼, 徐华清, 等 (149)
基于物质流分析方法的生态海岛建设研究——以长海县为例 陈东景, 郑 伟, 郭惠丽, 等 (154)
再生(污)水灌溉生态风险与可持续利用 陈卫平, 吕斯丹, 张炜铃, 等 (163)
基于流域单元的海湾农业非点源污染负荷估算——以莱州湾为例 麻德明, 石洪华, 丰爱平 (173)

集约用海对海洋生态环境影响的评价方法 罗先香,朱永贵,张龙军,等 (182)

城乡与社会生态

基于生态系统服务的城市生态基础设施:现状、问题与展望 李 锋,王如松,赵 丹 (190)

北京城区道路系统路网空间特征及其与 LST 和 NDVI 的相关性 郭 振,胡 聰,李元征,等 (201)

基于复合生态功能的城市土地共轭生态管理 尹 科,王如松,姚 亮,等 (210)

重庆市森林生态系统服务功能价值评估 肖 强,肖 洋,欧阳志云,等 (216)

渤海湾港口生态风险评估 彭士涛,覃雪波,周 然,等 (224)

达标污水离岸排海末端处置技术研究综述 彭士涛,王心海 (231)

Abstract: The feeding, burrowing, and reworking of benthic invertebrates, collectively termed bioturbation. Bioturbation is one of most important ecological processes, which can cause the redistribution of particles and interstitial water in sediments, and therefore have significant affects on the physical, chemical and biological properties of the sediment. In particular, bioturbation redistribute particles and porewater in sediment and thereby increase the surface area available for sediment-water interface exchange of nutrients and contaminants, resulting in significant changes on the sorption characteristics of the sediment. Hence, the environmental behavior of contaminant in sediment was significantly influenced by the bioturbation. For the nitrogen, bioturbation can impact it's biogeochemistry in two routes. One is that bioturbation can stimulate the solute exchanges (oxygen and metabolites) across the water-sediment interface and then enhance the microbial processes such as nitrification and denitrification. The other is that bioturbation can enhance the exposed area of sediment to water and air, thus accelerated the exchange of nitrogen at the sediment-water interface. For the phosphorus, the bioturbation have significantly effect on it's biogeochemical cycling, including the increase of the release of soluble reactive phosphorus (SRP) from sediment to water and alteration the chemical form of phosphorus. Furthermore, the degradation of organic phosphorus was enhanced by bioturbation. For heavy metals, bioturbation can alter the environmental behavior of metals in sediment in several ways. The first way is that the spatial heterogeneity of sedimentary metal levels was influenced by the bioturbation. The second way is that the bioturbation lead to a significant flux of metals to water. The third

way is that the bioturbation can affect the chemical form of heavy metals. For the hydrophobic organic contaminants (HOCs), the release, bioaccumulation and biodegradation of them were significantly affected by the bioturbation. On one hand, bioturbation can lead to a significant increase flux of HOCs to water. On the other hands, bioturbation can enhance the benthos bioaccumulation the HOCs. Addition, due to bioturbation has been confirmed to increase the abundance of microorganisms and the oxygen in the sediment, thus the biodegradation of HOCs were enhanced.

Key Words: bioturbation; sediment; nitrogen and phosphorus; heavy metal; hydrophobic organic contaminants (HOCs); environmental behavior

水-沉积物界面是联系底泥与上覆水的桥梁,控制有机质、营养盐和各种污染物的迁移转化过程^[1]。这些过程不仅受到沉积物理化性质(如有机质含量、渗透性)的影响,同时也受到沉积物生物性质(主要指生活于其中的各种生物)的影响^[2-3]。底栖动物栖息于沉积物中,它们的各种活动,如摄食、避敌、排泄等行为,被称之为生物扰动^[4]。生物扰动是构成河口、近岸和浅海水域关键生态过程的水层与底栖系统耦合过程的重要环节和枢纽^[5]。由于生物扰动造成的沉积物变化不明显,过去经常受到忽视^[6]。例如,传统的观点认为滨海沉积物结构的变化主要是由于海浪等物理作用^[7]。直到近十年,生物扰动才得到重新认识,被认为是一个非常重要的生态过程^[8]。一个小尺度(μm — m)的生物扰动同样是一个关键过程,可以改变大尺度(如 50 m—100 km)的沉积结构^[9]。与此同时,生物扰动还影响浅海物质交换及生态系统功能^[10-11]。生物扰动因此被称为“生态系统工程师”^[12]。

沉积物是水生生态系统的重要组成部分,蓄积各种污染物。由于生物扰动能改变沉积物的结构和性质,因而对其中的污染物产生重要影响^[13]。近年来,生物扰动对沉积物中污染物的环境行为的影响受到广泛研究,本文综述了该领域若干研究进展,为进一步了解生物扰动对污染物的生物地球化学循环提供基础资料。

1 生物扰动的概念、作用类型及影响因素

1.1 生物扰动概念

生物扰动是一个古老概念,早在达尔文时代已被提出来,他注意到土壤被蚯蚓扰动后,土壤上层的物质被带到下层,下层的被带到上层,结果造成了土壤的均质化^[14]。随后,在海洋中也发现类似的现象,如在海蚯蚓对海沙的扰动^[15]、海参对沉积物的

扰动^[16]。随着研究的深入,生物扰动概念得到进一步拓展,即生物对土壤和沉积物的再建过程,不仅包括陆地上,也包括水体中(图 1)^[14]。由于目前生物扰动的研究多见于水环境中,因此,生物扰动一般是指底栖动物由于摄食、建管、筑穴、爬行、避敌、分泌、排泄和迁移等行为造成沉积物结构和性质的改变,进而影响到沉积物中颗粒态和溶解态物质迁移转化的过程。

1.2 生物扰动作用类型

生物扰动作用类型可分为沉积物颗粒重建和洞穴通水两大类,大类下又分为 6 个亚类(图 2)^[17]。颗粒重建主要指底栖动物各种行为造成的沉积物颗粒移动,洞穴通水是指底栖动物为了呼吸和觅食而对洞穴中水和上覆水进行交换^[18]。两种扰动类型对沉积物产生不同的作用(表 1)^[19-20]。

表 1 生物扰动类型及其对沉积物的影响

Table 1 Bioturbation modes and their effect on the sediment matrix

生物扰动类型 Bioturbation mode	效应 Effect	搬运过程 Transport process	沉积物种类 Sediment type	搬运类型 Transport type
颗粒重建 Particle reworking	Biomixing 生物混合	筑穴 Burrowing	沙、泥 Sand, mud	扩散 Diffusion
洞穴通水 Burrow ventilation	生物淋洗 Bioirrigation	沉食性取食 Deposit-feeding	沙、泥 Sand, mud	非本地 Non-local
		洞穴水交换 Burrow flushing	沙、泥 Sand, mud	非本地 Non-local
		间隙水迁移 Pore water transport	沙 Sand	平流输送/扩散 Advection/diffusion
			泥 Mud	扩散 Diffusion

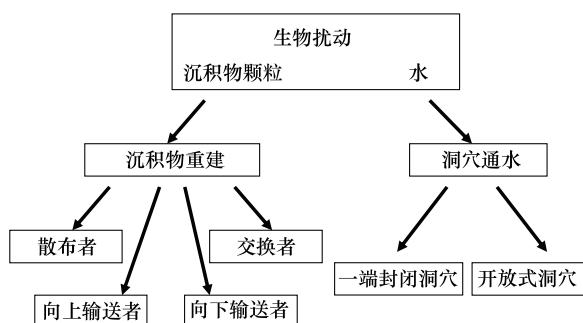

图 2 生物扰动作用类型
Fig.2 The categories of bioturbation

1.3 生物扰动作用影响因素

1.3.1 底栖动物种类

不同底栖动物有不同的生活习性,由此产生不同的沉积物混合模式,导致不同的颗粒位移,从而对沉积物产生不同的扰动强度。首先是觅食和摄食习性。底栖动物的觅食和摄食的活动控制了沉积物颗粒的位移^[21]。如摄食和排粪主要发生在沉积物表层附近,因此沉积物混合模式以水平方向为主^[22-23];其次是筑穴行为,主要取决于巢穴的深度,产生的扰

动强度在垂直空间上存在差异。如甲壳、双壳类动物的巢穴主要分布沉积物浅层,而环节动物和其它类似蠕虫的类群则趋向于分布在深层沉积物,因而前者主要对沉积物浅层产生扰动,后者则对深层产生扰动^[24]。此外,底栖动物的体积、生物量等也影响其对沉积物的扰动强度^[6]。实际上,动物种类的影响可以归纳为功能群^[6]。目前,可将作为生物扰动者的底栖动物分为 5 个功能群(图 3),即散布者、向下输送者、向上输送者、交换者和廊道散布者^[25-26]。这些功能群对沉积物产生不同的扰动效果。

1.3.2 底栖动物密度

底栖动物的密度对生物扰动强度有显著影响,两者间呈正相关^[27]。例如,高密度沙蚕 (*Hediste diversicolor*) 对沉积物的扰动强度明显高于低密度^[28]。

1.3.3 沉积物有机质含量

底栖动物的生物扰动强度受到食物供给的影响^[29]。由于沉食底栖动物主要以沉积物为食,因此

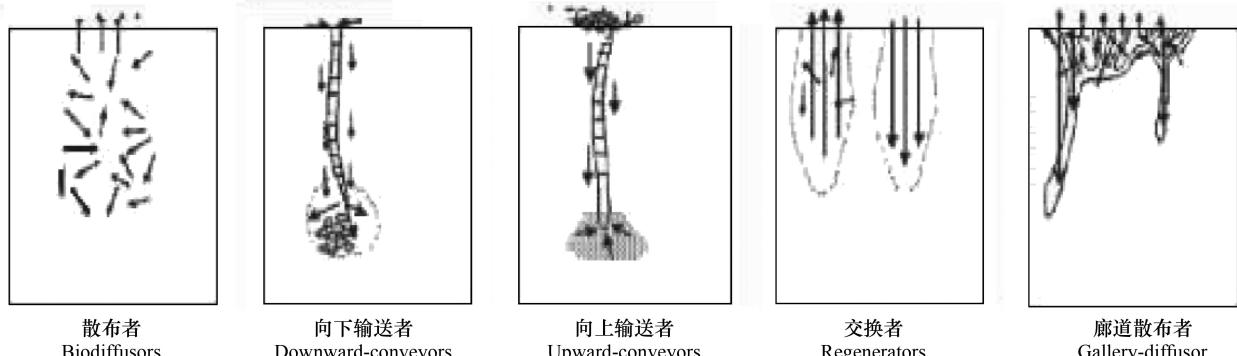

图 3 生物扰动者功能群
Fig.3 Functional groups of bioturbators

沉积物中的有机质含量直接影响了其生物扰动强度^[30]。在有机质含量低的沉积物中,底栖动物为了生存不得不摄食大量的沉积物^[24],由此对沉积物产生强烈的扰动作用。相反,在有机质含量高的沉积物中,底栖动物只需要取食少量的沉积物即可满足营养需求,降低了沉积物处理速度,生物扰动强度随之降低^[24]。

1.3.4 沉积速率、水深和粒径

通常,沉积速率高,为沉食的底栖动物带来的食物就多,从而能够供养更多的底栖动物,表现为较强的扰动强度^[31]。水深对生物扰动的影响实质上与营养供给相关。水浅,营养物质高,生物扰动强度大;水深,营养物质少,生物扰动强度小。如在富营养的近岸海域,底栖动物对沉积物的扰动深度可以达到100cm以下^[32];而在贫营养的深海,底栖动物的扰动深度最深只能到20cm左右^[33]。沉积物粒径

同样对生物扰动强度产生影响。由于沉食底栖动物对细颗粒沉积物有优先摄食和向下输送的习性,因此生物扰动强度表现明显的粒径相关^[34],如在加拿大的Fundy湾,生物扰动强度随沉积物粒径增大而减弱^[35]。

2 生物扰动对沉积物中污染物的环境行为影响

在生物扰动的作用下,沉积物的结构和性质发生了改变。由此影响蓄积于沉积物中的污染物的各种环境行为。其中一个非常重要的影响是促进沉积物中的污染物向水体释放(图4)^[36];与此同时,沉积物中的污染物还会被生物扰动者所富集;此外,还引起沉积物中含氧量和微生物等变化,从而间接影响污染物的环境行为。因此,生物扰动使得蓄积于沉积物中的污染物的环境行为更加复杂。

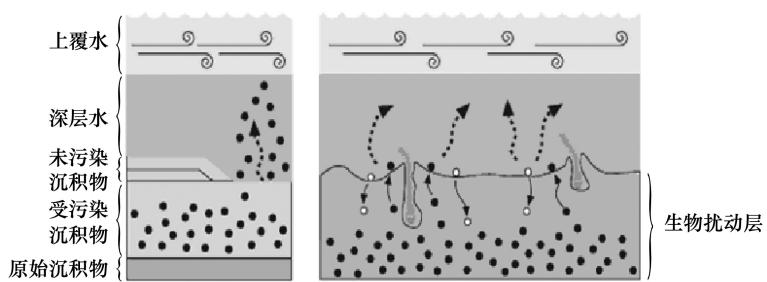

图4 生物扰动导致沉积物向水体释放污染物

Fig.4 Processes of chemical release from a sediment bed contaminant source

2.1 生物扰动对氮、磷影响

2.1.1 氮

在生物扰动作用下,沉积物一个重要的变化特征是含氧量增加^[37-38]。例如,在摇蚊(*Chironomid larvae*)扰动沉积物的实验中,对照组沉积物含氧量随深度而减少,在4mm处含氧量降低至0,而生物扰动处理的沉积物,在7mm处,含氧量仍可达到5mg/L^[39]。沉积物含氧量的变化对其中氮的硝化与反硝化作用产生重要影响^[40]。因此,生物扰动影响硝化与反硝化作用。通常,生物扰动显著提高硝化作用^[41]。这种促进作用受到多种因子影响。Pelegrini和Blackburn发现,在较低密度时(20000个/m²),正颤蚓(*Tubifex tubifex*)的生物扰动提高氮的硝化,而在高密度时(70000个/m²)却降低氮的硝化^[42],表明底栖动物密度影响硝化作用。Nogaro和Mermillod-Blondin的研究表明,颤蚓的生物扰动对不

同来源的沉积物中的氮的硝化作用影响完全不同,对于来自大学校园的沉积物,生物扰动显著提高了氮的硝化,而对来自工业区的沉积物,氮的硝化并没有受到生物扰动的影响^[43],表明沉积物的性质也影响到氮的硝化。当沉积物中含有硫化物时,由于生物扰动促进硫化物释放,这些硫化物抑制微生物生长,从而降低了硝化作用^[38]。可见,生物扰动对硝化用影响不同,受多种因素影响。生物扰动也能影响沉积物中氮的反硝化作用。摇蚊的生物扰动能将总反硝化速率从(0.76±0.34) mmol N m⁻² d⁻¹提高到(5.50±1.30) mmol N m⁻² d⁻¹,极大提高了反硝作用^[39]。最近的研究表,生物扰动对不同深度的沉积物反硝化作用影响不同,在海姑虾(*Neotrypaea californiensis*)的扰动下,沉积物深度在13cm以上的反硝化速度低于没有生物扰动处理,而在13cm以下却是生物扰动处理高于无生物扰动处理^[40]。这

一方面表明生物扰动促进深层沉积物中的氮发生反硝化作用,另一方面也说明生物扰动影响反硝化作用也受到其它因素的影响。

生物扰动促进沉积物向水体释放氮营养盐。Fanjul 等在河口湿地发现,在有无穴居蟹 *Neohelice granulata* 的沉积物间隙水中的氮营养盐含量存在明显差异,无论是硝酸盐还是氨氮,都呈现有蟹居住的洞穴>无蟹居住洞穴>无蟹分布区的分布特征^[44]。表明穴居蟹的生物扰动促进沉积物向水体释放氮营养盐。Mermillod-Blondin 的室内微宇宙研究证明了这一点,颤蚓的生物扰动提高氨氮从沉积物向水体的释放达到 200%^[45];其它底栖动物,如环节动物 *Marenzelleria* sp.的生物扰动也显著提高沉积物中的氨氮向水体释放量^[46]。生物扰动造成沉积物中氨氮释放主要通过生物淋洗 (Bioirrigation) 作用完成^[40]。例如在浅海湾,76%的氨氮从沉积物向水体的释放归结于生物淋洗作用^[47]。生物扰动促进沉积物中的氮向水体释放的主要原因是生物扰动造成了沉积物的搬运和混合,使沉积物吸附的营养盐得以释放,加快间隙水中物质的扩散速率和溶解速率,从而增加氮在沉积物-水界面上的交换通量^[48]。

2.1.2 磷

磷在沉积物中的环境行为也受到生物扰动的影响。一方面,生物扰动促进沉积物中溶解性磷 (SRP) 向水体释放。Mermillod-Blondin 的研究表明,颤蚓的生物扰动提高了 190% 的 SRP 从沉积物向水体释放^[45]。Swan 等发现在溶解氧较低的水平下, *Neanthes succinea* 的生物扰动提高 SRP 的释放速率达到 60%—70%^[49]。然而,有些底栖动物的生物扰动却抑制了 SRP 向水体释放^[50]。如水丝蚓的生物扰动不但没有促进沉积物中 SRP 向水体释放,相反,还抑制了沉积物中 SRP 的释放^[51]。造成这种现象的原因是沉积物中的一些矿物质在生物扰动的作用下增强对间隙水 SRP 吸附所导致^[50]。间隙水 SRP 浓度的降低会减小 SRP 向水体扩散的浓度梯度,从而减小 SRP 的释放通量,甚至产生沉积物对水体中 SRP 的吸附^[52-53]。由此可见,生物扰动对沉积物中 SRP 的促进/抑制释放作用不仅取决于生物扰动者,还与沉积物特点相关。

另一方面,生物扰动还能改变沉积物中磷的化学形态。河蚬的生物扰动增加了沉积物中铁结合态

磷含量^[54]。这是由于生物扰动提高沉积物中的氧含量,氧化了间隙水中 Fe²⁺,氧化反应所生成的水合铁氧化物对 SRP 具有良好的吸附作用^[50],从而形成铁结合态磷。

此外,生物扰动还促进有机磷降解。Hietanen 等的研究表明,加入底栖动物 12d 后,沉积物中的有机磷发生了降解^[46]。由于有机磷包括多种物质,生物扰动对有机磷不同组分影响不同。目前,磷脂和 DNA 在生物扰动下能发生快速分解或转化得到证实^[55]。对于其它有机磷,生物扰动是否能促进其降解并不清楚。

2.2 生物扰动对重金属影响

2.2.1 改变重金属在沉积物中的分布

Benoit 等发现美国波士顿港的沉积物中甲基汞的垂直分布受片脚类动物生物扰动的影响,随着生物扰动强度的增大,甲基汞含量最高值点向下迁移^[56]。Klerks 等对海姑虾的生物扰动对美国 Tampa 沉积物中锌与镉的分布研究表明,在有海姑虾活动区域的沉积物中锌与镉的含量是没有海姑虾活动区域的 3 倍,说明生物扰动显著改变了重金属在沉积物中的水平分布^[57]。室内的实验研究表明,颤蚓的生物扰动能促进水体中的 Pb 向沉积物深层扩散^[58]。可见,生物扰动不仅改变重金属在沉积物中的垂直分布,也改变其在沉积物中的水平分布。

2.2.2 促进重金属从沉积物向水体释放

Simpson 等对悉尼港的 5 个河口沉积物锌释放研究表明,5 周后,没有生物的对照组中锌的释放速率为 $27 \text{ mg m}^{-2} \text{ d}^{-1}$,而有生物的释放速率为 $71 \text{ mg m}^{-2} \text{ d}^{-1}$,说明生物扰动显著增强沉积物向水体释放重金属^[59]。Ciutata 等研究表明,颤蚓生物扰动促进沉积物中的镉向水体释放,但以颗粒态为主,与生物扰动导致沉积物的再悬浮相关^[60]。同样的结果见路永正和阎的研究,他们发现颤蚓的生物扰动显著提高了上覆水中颗粒态镉的浓度^[58]。生物扰动还通过改变沉积物的理化性质,从而促进沉积物向水体释放重金属。例如,生物扰动增加沉积物的氧含量,增强生物扰动强度,促进沉积物中甲基汞向水体迁移^[61-62]。

2.2.3 改变重金属化学形态

在水环境中,硫酸盐还原菌是控制甲基汞生成的重要因子^[63]。由于生物扰动能为间隙水提供氧

化剂,降低二价硫离子的生成,从而减少了甲基汞形成^[56]。然而,Nogaro等的研究却得到相反的结论,他们发现生物扰动增强沉积物中微生物的有氧呼吸,促进甲基汞形成^[64]。两个截然不同的结论,表明生物扰动对沉积物中甲基汞的影响错综复杂。

镉是沉积物中常的污染物,在不同的条件下具有不同的化学形态。由于生物扰动改变沉积物的pH值、氧化还原电位等,因而对蓄积于沉积物中的镉的化学形态产生重要影响。颤蚓的生物扰动提高镉从沉积物内部微孔向溶液中扩散的速率,进而提高沉积物中镉的迁移能力,促进镉从铁锰氧化物结合态向可交换态转移^[65]。由于生物扰动增大沉积物比表面积,不断更新沉积物颗粒上的吸附点位^[60],有利于碳酸盐矿物颗粒对镉离子的再吸附,形成碳酸盐结合态镉;与此同时,呼吸作用产生的CO₂能增加其中CO₂⁻³浓度,也有利于增加碳酸盐结合态镉^[65]。可见,生物扰动增强沉积物碳酸盐矿物对镉的吸附能力,对于控制水-沉积物界面镉的交换具有重要作用。

2.3 生物扰动对疏水性有机污染物影响

2.3.1 促进向水体释放

生物扰动促进沉积物中的疏水性有机污染物(Hydrophobic organic contaminants, HOCs)向水体释放已成为共识^[66]。Schaanning等发现,大型底栖动物的生物扰动可以使挪威奥斯陆港沉积物的PAHs、PCBs和DDT等污染物分别以每天243、19.6 pmol/m²和13.6 pmol/m²的速度向水体释放^[67]。Menone等野外调查了穴居蟹*Chasmagnathus granulatus*的生物扰动对阿根廷的Bahía Blanca河口沉积物中的有机氯农药影响,结果表明,生物扰动显著提高沉积物向水体释放有机氯农药^[68-69]。Granberg等研究发现,生物扰动促进波罗的海沉积物中的PCBs向水体释放^[70]。类似的结果在Josefsson等的研究中也得到,他们发现,在利用活性炭对受二苯并二恶英和二苯并呋喃(PCDD/Fs)污染的沉积物进行原位修复时,由于底栖动物的存在,它们的生物扰动促进沉积物中的PCDD/Fs向水体迁移,影响了修复效果^[71],因此,在对沉积物进行修复时,应该考虑底栖动物生物扰动的影响^[72-73]。研究表明,底栖动物的排泄物中含有许多溶解性有机质(DOC)及小分子的物质,提高间隙水中的DOC含量,由于DOC对有机物具有

很强的吸附能力,由此引发PAHs在沉积物-间隙水的重新分配,从而提高了水相中的PAHs含量^[74]。即,生物扰动打破了有机污染物在沉积物-水界面的动力学平衡,使沉积物中的HOCs发生解吸^[74-76]。其它一些HOCs,如多溴联苯醚(PBDEs)^[77]、医药品和个人护理品(PPCPs)^[75],生物扰动也能促进它们向水体释放。然而,HOCs的释放还受到其化学性质影响。通常,疏水性高的有机污染物,不易发生解吸。例如,底栖动物*Chironomus dilutus*和*Hyalella azteca*的生物扰动并不能显著提高乙炔基雌二醇(EE2)从沉积物向水体释放,与EE2具有较高的疏水性特点相关^[75]。此外,沉积物的特点也影响生物扰动促进HOCs释放的效果。如沉积物中的黑炭由于具有较强的吸附能力,抑制生物扰动促进沉积物中HOCs解吸^[78]。

传统的观点认为,生物扰动主要是增加水体中颗粒态污染物^[70]。笔者的研究得到类似的结论,在天津厚蟹(*Helice tientsinensis*)的生物扰动下,水体中PAHs的颗粒态是其溶解态的4倍,表明生物扰动以促进颗粒态污染物释放为主^[12, 60]。生物扰动主要促进颗粒态HOCs释放也得到Josefsson等的研究结果支持^[77]。然而,近年的研究表明,生物扰动也增加水体中溶解态的污染物^[70, 79]。Granberg等研究发现,*Marenzelleria neglecta*的生物扰动释放的溶解态PCBs要高于其颗粒态一个数量级,表明生物扰动促进沉积物PCBs释放以溶解态为主^[70]。这种差异可能与动物种类、密度、沉积物性质以及水化学条件相关^[13]。

生物扰动无论是促进溶解态还是颗粒态HOCs释放,都造成二次污染。特别是溶解态的HOCs,生物扰动提高了它们的生物有效性^[76]。如夹杂带丝蚓(*Lumbriculus variegatus*)的生物扰动显著提高了美洲钩虾(*Hyalella azteca*)对PAHs的富集^[80]。通常认为颗粒态HOCs不易被生物利用,但最近的研究表明,颗粒态的多溴联苯醚也能被鲤鱼(*Cyprinus carpio*)所富集^[81]。由此可见,生物扰动促进沉积物的HOCs释放,这些HOCs能被水生生物所利用,最终通过食物链传递到人类,对人类健康造成潜在的风险。

2.3.2 加强富集和代谢

由于底栖动物几乎终生生活在沉积物中,因此

通过体表吸收和摄食沉积物,使得 HOCs 更容易富集于其体内。一项对日本 Ariake 海滨的生物体 PCBs 和 PAHs 的调查研究表明,PCBs 在比目鱼体内的含量为 3.6 ng/g(湿重)、蛤为 68 ng/g、弹涂鱼为 1700 ng/g 脂肪;PAHs 在沙躅属动物体内含量为 24 ng/g(湿重)、牡蛎为 6.3 ng/g、蛤为 6.3 ng/g、蟹为 4.2 ng/g、弹涂鱼为 2.9 ng/g^[82]。在渤海湾的北塘河口附近的天津厚蟹,总 PAHs 含量达到(8816±2885) ng/g 脂肪^[74]。水丝蚓^[81]、沙蚕^[83]对多溴联苯醚也具有不同的富集能力。

某些底栖动物对 HOCs 还具有代谢能力。穴居蟹^[68-69]、蓝蟹^[84]对有机氯农药具有代谢能力。一些环节动物(如 *Clymenella torquata*, *Nereis virens*, *N. succinea*, *Nephthys incisa*, *Spiro setosa*, *Cirriformia grandis*)、双壳类(如 *Macoma balthica*, *Mya arenaria*, *Mulinia lateralis*)以及一些片脚类动物(如 *Ampelisca abdita*, *Leptocheirus plumulosus*)可以代谢 PAHs^[85]。此外,一些虾类可以代谢 PCBs^[86]。沙蚕对多溴联苯醚也具有一定的代谢能力^[83]。

2.3.3 提高生物降解

底栖动物的生物扰动可以间歇性地向深层的无氧区输送氧、直接或者间接影响微生物菌群变化,使颗粒物纵向迁移^[87-88];同时,底栖动物的排泄物有助于 HOCs 从沉积物中解吸^[74-76],促进 HOCs 与微生物接触;此外,底栖动物消化液中的助溶剂对生物降解有很好的促进作用^[89];这些因素都有利于促进沉积物中 HOCs 发生生物降解。Granberg 等对 *Amphiura filiformis* 和 *N. diversicolor* 的生物扰动对微生物降解芘的研究发现,相对于深层的沉积物,在洞穴中的沉积物中的芘的含量明显减少,表明生物扰动促进微生物降解芘^[90];Timmermann 等通过室内研究发现,有生物扰动的装置中,芘的降解提高了 180%—200%倍^[91]。物扰动促进沉积物中 HOCs 生物降解是由于生物扰动增加沉积物中的含氧量,从而提高了微生物降解 HOCs 的能力^[89]。生物扰动促进 HOCs 生物降解取决于生物扰动者和污染物在沉积物中的深度。通常,降解主要发生在沉积物浅层,与生物扰动者主要活动于该区域相关^[89]。

4 结语

生物扰动是沉积物中污染物动态变化的一个关

键因子。目前,生物扰动对沉积物中的污染物的环境行为的影响开展了一系列的研究,了解一些影响机制。底栖动物通过生物泵、再悬浮、分泌物排泄等过程影响沉积物中的污染物并造成释放^[92]。生物扰动影响沉积物中的污染物环境行为受控于多种环境因子,包括温度^[93]、有机质^[42]、水动力^[10]、污染等^[94]。特别是污染的影响,最近的研究表明,污染影响生物扰动者的行为,进而影响沉积物的地球化学循环^[95]。可见,生物扰动和沉积物中的污染物相互关系错综复杂,两者之间的关系需要进一步研究。

数学模型是了解生物扰动和沉积物中污染物相互关系的重要研究手段。在生物扰动对沉积物结构的影响研究中,许多模型如箱式模型、平流模型、信号处理模型、扩散-反应模型和颗粒物输运扩散模型等已被广泛运用^[96],取得良好效果。但在生物扰动对沉积物中污染物的影响研究中,鲜有运用数学模型,这方面研究急需加强。

总体而言,生物扰动对沉积物中在氮、磷和重金属的环境行为影响研究相对较多,而对于 HOCs 研究较少,特别是生物扰动对 HOCs 的生物降解研究更少。因此,今后有必要开展这方面的研究,同时应该对生物扰动对促进沉积物中污染物的二次释放进行风险评估,正确认识其潜在的生态风险。

ACTA ECOLOGICA SINICA Vol.34, No.1 Jan., 2014(Semimonthly)
CONTENTS

Foreword: Complexity and Sustainability	(I)
Frontiers and Comprehensive Review	
Urban eco-complex and eco-space management	WANG Rusong, LI Feng, HAN Baolong, et al (1)
Review of carbon sequestration assessment method in the marine ecosystem	SHI Honghua, WANG Xiaoli, ZHENG Wei, et al (12)
A review of sensitivity model for urban ecosystems	YAO Liang, WANG Rusong, YIN Ke, et al (23)
Urban ecological metabolism of municipal solid waste: a review	ZHOU Chuanbin, XU Wanying, CAO Aixin (33)
Autecology & Fundamentals	
Parameter sensitivity analysis of a coupled biological-physical model in Jiaozhou Bay	SHI Honghua, SHEN Chengcheng, LI Fen, et al (41)
Macroinvertebrate investigation and their relation to environmental factors in Bohai Bay	ZHOU Ran, QIN Xuebo, PENG Shitao, et al (50)
Review of the impacts of bioturbation on the environmental behavior of contaminant in sediment	QIN Xuebo, SUN Hongwen, PENG Shitao, et al (59)
Population, Community and Ecosystem	
Ecosystem services' spatial characteristics and their relationships with residents' well-being in Miyun Reservoir watershed	WANG Dashang, LI Yifeng, ZHENG Hua, et al (70)
Contingent valuation of preserving ecosystem of Changdao Island Nature Reserve	ZHENG Wei, SHEN Chengcheng, QIAO Mingyang, et al (82)
Discussion of carbon sequestration estimates in the island terrestrial ecosystems	WANG Xiaoli, WANG Ai, SHI Honghua, et al (88)
Landscape, Regional and Global Ecology	
An integrated indicator on regional ecological civilization construction	LIU Moucheng, SU Ning, LUN Fei, et al (97)
The eco-environmental evaluation based on habitat quality and ecological response of Laizhou Bay	YANG Jianqiang, ZHU Yonggui, SONG Wenpeng, et al (105)
Analysis of the evolution and value of coastal ecosystem services at Gudong Coast in the Yellow River Delta since 1985	LIU Dahai, CHEN Xiaoying, XU Wei, et al (115)
Research of index system framework in marine ecology monitoring & regulation areas division based on complex ecosystem of nature-human-society	XU Huimin, DING Dewen, SHI Honghua, et al (122)
The environmental function assessment and zoning scheme in China	WANG Jinnan, XU Kaipeng, CHI Yanyan, et al (129)
Resource and Industrial Ecology	
Definition and evaluation indicators of ecological industrial park's complex eco-efficiency	LIU Jingru, LÜ Bin, ZHANG Na, et al (136)
Spatial-temporal distribution of agricultural eco-efficiency in China	CHENG Cuiyun, REN Jingming, WANG Rusong (142)
The coupling mechanism and industrialization mode of ecological restoration in the weak semi arid mining area of Inner Mongolia	CHEN Yubi, HUANG Jinlou, XU Huaqing, et al (149)
Evaluation of ecological marine islands construction based on material flow analysis: a case study of Shanghai County	CHEN Dongjing, ZHENG Wei, GUO Huili, et al (154)
Ecological risks and sustainable utilization of reclaimed water and wastewater irrigation	CHEN Weiping, LÜ Sidan, ZHANG Weiling, et al (163)

-
- Estimation of agricultural non-point source pollution based on watershed unit; a case study of Laizhou Bay MA Deming, SHI Honghua, FENG Aiping (173)
The evaluation method in the impact of intensive sea use on the marine ecological environment LUO Xianxiang, ZHU Yonggui, ZHANG Longjun, et al (182)

Urban, Rural and Social Ecology

- Urban ecological infrastructure based on ecosystem services;status,problems and perspectives LI Feng, WANG Rusong, ZHAO Dan (190)
Spatial features of road network in Beijing built up area and its relations with LST and NDVI GUO Zhen,HU Dan,LI Yuanzheng, et al (201)
The conjugate ecological management model for urban land administration based on the land complex ecological function YIN Ke, WANG Rusong, YAO Liang, et al (210)
Value assessment of the function of the forest ecosystem services in Chongqing XIAO Qiang, XIAO Yang, OUYANG Zhiyun, et al (216)
Ecological risk evaluation of port in Bohai Bay PENG Shitao, QIN Xuebo, ZHOU Ran, et al (224)
Research review of the tail disposal technology of the standard sewage offshore outfall PENG Shitao,WANG Xinhai (231)

《生态学报》2014 年征订启事

《生态学报》是由中国科学技术协会主管,中国生态学学会、中国科学院生态环境研究中心主办的生态学高级专业学术期刊,创刊于1981年,报道生态学领域前沿理论和原始创新性研究成果。坚持“百花齐放,百家争鸣”的方针,依靠和团结广大生态学科研工作者,探索生态学奥秘,为生态学基础理论研究搭建交流平台,促进生态学研究深入发展,为我国培养和造就生态学科研人才和知识创新服务、为国民经济建设和发展服务。

《生态学报》主要报道生态学及各分支学科的重要基础理论和应用研究的原始创新性科研成果。特别欢迎能反映现代生态学发展方向的优秀综述性文章;研究简报;生态学新理论、新方法、新技术介绍;新书评价和学术、科研动态及开放实验室介绍等。

《生态学报》为半月刊,大16开本,280页,国内定价90元/册,全年定价2160元。

国内邮发代号:82-7,国外邮发代号:M670

标准刊号:ISSN 1000-0933 CN 11-2031/Q

全国各地邮局均可订阅,也可直接与编辑部联系购买。欢迎广大科技工作者、科研单位、高等院校、图书馆等订阅。
